And in accordance with law, and an order of the Board of Trustees, made on the said 4th day of January, 1866, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., at No. 626 Montgomery street, San Francisco, Cal., on the 21st day of February, 1866, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JOSEPH GREEN, Secretay.

Office, 330 Davis street, San Francisco. feb3

POSTPONEMENT.—The above sale is hereby postponed until Friday, March 2, 1866, at the same hour and place. By order of the Board of Trustees.

feb10 JOSEPH GREEN, Secreary.

Yuba Gold and Silver Mining Company, Brown's Valley, Yuba County, State of California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 1st day of January, 1866, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Borges, P	36	1	$ 3 00
Contrron, J B	326	2½	7 50
De Montpreville, C	89	12	36 00
De Montpreville, C	90	13	39 00
Hochstadter & Bro	244	20	60 00
Hochstadter & Bro	249	10	30 00

And in accordance with law, and an order of the Board of Trustees, made on the 1st day of January, 1866, so many shares of each parcel of said stocks may be necessary, will be sold at public auction, by Messrs. Olney & Co., at No. 626 Montgomery street, San Francisco, Cal., on Saturday, the 17th day of February, 183, at the hour of 12 o'clock M. of said day, to pay said dlinquent assessment thereon, together with costs of advertising and expenses of sale.

P. R. RINGSTROM, Secretary.

Office, 210 Pine street, up-stairs, San Francisc. feb3

POSTPONEMENTS.—We would againcall the attention of Secretaries to a certainpoint of the mining law, too commonly overloced, viz: The requirement that all postponements must be added previous to the expiratin of the regular publication of assessmen or sale notices.

Postponements and Alterations.—Secretaries are requested to give notice of postponements, alterations which they may desire made in their advtisements at their earliest convenience. New advertisemits should be sent in as early as possible.

Delays are Dangerous.—Inventors in the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers (securing patents almost immediately, thereby avoiding the three months delay requisite in transacting buness through Eastern agencies.

Our Circulation.—THE MINING AND SCIENTIFIC PRESS has a large and permanent subscription list, and enjoys a more universal circulation among stockholders and persons directly interested in mining than anyther paper on this const.

VALUE OF A SUMMER STORM.—A good summer storm is a rain of riches. If gold and silver rattled down from the clouds, they would not enrich the land so much as soft, long rains. Every drop is silver going to the mint. The roots are machinery, and catching the willing drops, they assay them, refine them, roll them, stamp them, and turn them out coined berries, apples, grains and grasses. All the mountains of California are not so rich as are the soft mines of heaven.

CURIOUS CAUSE OF DEATH.—Mrs. Samuel L. Elmy, Providence, R. I., pricked her finger with a needle, recently, and afterward scoured a brass knocker. The hand soon began to swell, and she died from the effects of the wound in a few days.

J. B. CONE, BUSINESS AGENCY.—Makes private sales of Property and Business Places of every description, in the city and throughout the State; procures partners with large and small amounts of money; negotiates sales o mining property, and does a General Agency Business. Patronage solicited by mail, express, or by personal application at the office, 402 Montgomery Street, San Francisco, California. 23v11tf

Just and True Economy

The Proprietors of the MINING AND SCIENTIFIC PRESS would call the especial attention of MINING SECRETARIES, TRUSTEES and SHAREHOLDERS, to a few substantial reasons for the publication of Mining Notices in their journal—the first and only important newspaper of its class published upon this coast.

1st. The PRESS enjoys a large and permanent subscription list, having a more universal circulation among shareholders and men intimately connected with mining interests than any other publication.

2d. Under the present law the publication of all mining notices on Saturday, in a weekly journal, complies as fully with the statutes as a daily publication. It is generally found to be equally as convenient for secretaries, and decidedly preferable to stockholders who have not time to examine throughout every issue of a daily.

3d. Economy in mining should always be looked upon with favor, and the cost for weekly advertising in the PRESS is less by ONE HALF than the rates of any other journal in this city possessing a respectable circulation.

4th. The publishers of the PRESS, making the mining interest their especial care, take particular pains to assist in the avoidance of errors in advertising. Our print is also more clear and perfect than can be expected in such papers as are hurriedly issued from cylinder presses.

5th. Our "Shareholders' Directory" forms a complete index of all mining notices published in San Francisco, by reference to which shareholders can at once see if their company is advertised, and determine whether the same is inserted in the PRESS or some other paper.

6th. Many copies of the PRESS are bound by prominent professional men, mechanics, secretaries, brokers, shareholders and others, as an important record for future reference, thereby rendering advertising, of every class, in its columns, of peculiar and permanent value.

7th. The benefit of having all mining notices consolidated in one newspaper, for the common convenience of shareholders, secretaries, and others who have occasion to refer to the same, is obvious. With this view we have established our rates at only fair, living prices, believing that a journal whose interests are unfettered by party, creed, or prejudice, as the only medium which can reasonably ask for such a consolidation of mining patronage.

8th. Advertisements in the columns of the PRESS, after their first insertion, are arranged alphabetically. Our present list is equalled only in one instance by that of any other journal. Shareholders, as well as strangers, naturally turn their attention to a mining journal for information concerning the mines and mining matters.

LAST, BUT NOT LEAST.—Our sheet (having been recently enlarged to the size of Harpers' Weekly) is now only equalled in its dimensions by one mining paper in existence—the *London Mining Journal*. Published in this, the greatest mining field of the world, we desire that the PRESS shall have no superior. We can only realize our cherished object of building up reliable advocate of the science and business of mining which will be of just honor and profit to our community by experience and liberal patronage. The bestowal of such favors only as naturally belong to us, and which it is clearly by the benefit of the mining fraternity to extend, is all that is requisite, and we are confident we shall receive it.

DEWEY & CO.,
4v11 Office Mining and Scientific Press.

ANNUAL REPORT
—OF THE—
Pacific Insurance Company.

IN COMLIANCE WITH THE ACT OF THE LEGISLATure of the State of California, entitled "An Act concerning Corporations," passed April 22, 1850, the Pacific Insurance Company of San Francisco makes the following Anitial report.

I.—The mount of the Capital Stock of this Company is SEVEN [UNDRED AND FIFTY THOUSAND DOLLARS, and paida GOLD.....$750,000

II.—Th amount of the Assets is ONE MILLION AND FIFTY-ONE THOUSAND FOUR HUNDRED AND TWENTY DOLARS AND THIRTY-SEVEN CENTS..$1,051,420.37

III.—Th Company has NO DEBTS.

IV.—Th amount of insurance effected during the year, and whic remained in force December 31, 1865:

Fire.....$12,973,949
Marine.....484,408

This Company commenced underwriting Marine Risks, August 1, 65.

V.—This Company insures against the following risks, viz: BUILDINGS, HOUSEHOLD FURNITURE, MERCHANDIS, RENTS, LEASEHOLDS, VESSELS IN PORT AND THEIR CARGOES, and other PERSONAL PROPERTY, AGAINST LOSS OR DAMAGE BY FIRE.

Also, on REGOLEONS, TREASURY COMMISSIONS, PROFITS, and AR RISKS, and ON ALL MARINE AND INLAND NAIGATION RISKS, TO AND FROM ALL PORTS IN THE WRLD.

VI.—This omphny will take on any FIRST-CLASS RISK not to exceed $75,000 (the limit fixed by law), and on all large risks will reinsure to an extent consistent with PRUDENCE in ther RESPONSIBLE COMPANIES.

J. HUNT, President.
A. J. RALSTON, Secretary.

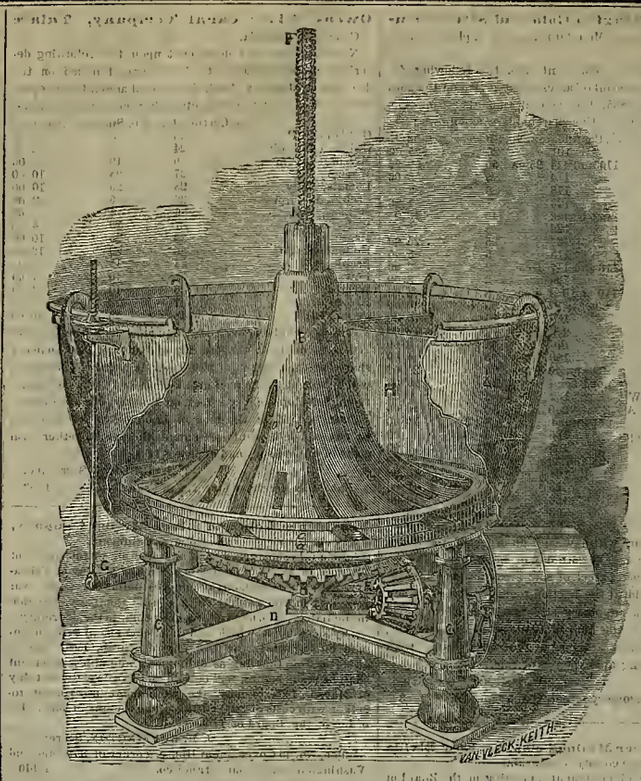
4v12-3m



THE EXCELSIOR
GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and *o*, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamater" will reduce one hundred and seventy-seven tons of orc, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE
Union Iron Works and Golden State Iron Works,
WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

The proprietor having introduced steam power in his Manufactory, has now increased facilities to supply the trade and the public in general. All articles from his establishment are guaranteed to be pure and unadulterated. The public are respectfully invited to call and convince themselves. Country orders promptly attended to.
15v11-3m

OIL WELL BORING.
J. SEVENOAKS,
Contractor
For Well Boring and Erecting all kinds of Machinery connected therewith.
Having had extensive experience in boring for oil in Pennsylvania, Canada and elsewhere, I feel confident of being able to give entire satisfaction. Persons desirous of making contracts as above, or wishing information with regard to oil indications, etc., will please address me at the office of the "Mining and Scientific Press," San Francisco, or to my personal address, Box 1229 San Francisco. 2v11

MINING PROPERTIES.
PARTIES WISHING MINING PROPERTIES CAN BE accommodated by applying to the Pacific Mineral Co., 434 California street, next door east of the Pacific Insurance office, up stairs. W. F. BRYANT, Agent.
N. B.—Parties forwarding Mining interests for disposal, are reminded that it is important to state such facts only as can be fully substantiated, upon a careful examination of said properties, thereby greatly enhancing the chances of success, and avoiding the useless loss of time and trouble.
1v12

ENGRAVED TO ORDER.—Persons who desire to illustrate their individual establishments or business, should give us their orders for Engraving and Printing, and we will guarantee good work and reasonable prices.
DEWEY & CO.,
Patent Agents, Publishers and Job Printers, 505 Clay st.

HAIR WASH.—A liquid that will color the human hair black, and not stain the skin, may be made by taking one part of bay rum, three parts of olive oil, and one part of good brandy, by measure. The hair must be washed with the mixture every morning, and in a short time the hair will be beautifully black, without injuring it in the least.

THE discovery of what is true, and the practice of what is good, are the two most important objects of life.

A RUGGED countenance often conceals the warmest heart; as the richest pearl sleeps in the roughest shell.

Too much is seldom enough. Pumping after your bucket is full prevents its keeping so.

THE Chinese miners' tax in Idaho is five dollars a month. The Celestials have a rougher road to travel, there, than in California.

BY MAIL.—The MINING AND SCIENTIFIC PRESS will be sent by mail to any part of the civilized world. In case of removal, subscribers have only to inform us of the post-office address of their old and new location, and the paper will be sent accordingly.

BACK VOLUMES.

Back files of the MINING AND SCIENTIFIC PRESS, from January 1st, 1861, to the present time, will be furnished at $3 per volume of six months; bound in cloth, $5

SEND US WORD.—If any subscriber to this journal fails to receive the same regularly and promptly, they will confer a favor by informing us at once.

RUGGLES' PRINTING PRESS

For Sale or Exchange.

The Proprietors of the MINING AND SCIENTIFIC PRESS have on hand a Half-Medium Ruggles' Engine Job Press, in condition good as new, which will be sold cheap, or exchanged for a good Hand-Press of medium or large size.

HENDY'S
IMPROVED BLOW-PIPE.
"This Convenient Helpmeet"
—TO THE—
ASSAYER, CHEMIST, DENTIST, JEWELLER, PROSPECTOR AND MILLMAN,

Can now be procured, at the Patentee's price, by sending your orders, by mail or otherwise, to the

Office of the Mining and Scientific Press.

This article was more fully mentioned in the PRESS of April 15th, 1865. Since that time, however, Mr. Hendy has made a further improvement by attaching a rubber hose between the mouth-piece and the pipe, enabling the blower to change his position without disturbing the direction or constant accuracy of the current on the object upon which it is turned. The main portion of the blow-pipe is made with a joint, at which a valve is placed, which is opened when the operator blows and closed immediately when he ceases. By this arrangement the little bag or bladder is readily filled at a single breath, and with very little exertion. When so filled, a continuous current of air is forced from the nozzle of the pipe by the mere contractive force of the gutta percha. This force is uniform until the air is very nearly exhausted. The current may be easily varied or entirely cut off by gently pressing the fingers upon the neck of the bladder above the nipple to which it is attached.

Price, Complete.....$5.00.

Machinery.

HUNTER'S
PREMIUM
CONCENTRATOR, AMALGAMATOR
AND SEPARATOR,
Awarded a Silver Medal at the late Mechanics' Fair.

HUNTER'S CONCENTRATOR CAN BE SEEN IN OPERATION daily at the Novelty Iron Works, Fremont street. Parties wishing to purchase Concentrators will find it to their advantage to examine the above machine before purchasing elsewhere, for the following reasons:

1st. It will work the sands from a 5-stamp battery, and save from 10 to 20 per cent. more sulphurets than any machine built on the Pacific coast.

2d. The Sulphurets are washed clean, containing less than ten per cent. of sand.

3d. The waste free gold and amalgam is amalgamated on the copper plates; no need of ground mercury and scarcely a trace of metal is run off with the sand.

4th. Its simplicity is a sufficient recommendation for its general use as a Concentrator. The variation of speed in a Quartz Mill does not affect the working of the Machine. The same was demonstrated at the late Mechanics' Fair, when with the greatest unsteadiness of speed the best of results were given.

5th. There is no clogging or stopping to clean out the sulphurets and sand, consequently no waste from any inattention on the part of the attendant.

6th. In exhibiting the working of the machine (it is not run empty), all classes of ores and tailings, from 50 pounds and upwards, are concentrated; that parties may see fit to test the machine with.

Give a trial, and satisfaction is guaranteed. All orders and any information required, address

ANDREW HUNTER,
Novelty Iron Works, Fremont st., San Francisco,
15v11-3m Or to E. T. STEEN, Agent.

BAUX & GUIOD'S
Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine Screening, Knowledge with Practical Experience, these Pans extract more gold and silver from their ores than any others in use, in a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan are the following: The trifling cost for attendance; its small cost; its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed for work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jefferson-ian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crall's Gravel Cement Works, Nevada county; Waltman's Chlorination Works, Nevada; Lail's Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Heugh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6m

BLAKE'S
QUARTZ BREAKER
Is now extensively used for breaking hard masses of
Quartz or Ores
To a size suitable for stamps. These machines are patented, and are in practical operation in
CALIFORNIA, AUSTRALIA,
WASHOE,
ENGLAND, FRANCE,
—AND—
THE ATLANTIC STATES.

These Machines, or circulars containing further information regarding them, may be obtained of the undersigned. Address,

BLAKE & TYLER,
Box 2077 San Francisco Post Office.
CHAS. T. BLAKE, Idaho City. E. TYLER, Michigan Bluff. WM. P. BLAKE, San Francisco.
4v10

Hepburn & Peterson's
AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, Bryant St. bet. 3d and 4th. Illustrated in the Mining and Scientific Press, April 8th, 1865.] HEPBURN & PETERSON.

12v11 416 Market street, San Francisco.

HUNT'S
IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person, and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN
HORSE POWER
For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

☞ For further Particulars see Small circulars. ☜

Portable Steam Engines!
"Hoadley's" and "Hittinger's" Make,
COMBINING THE MAXIMUM OF EFFICIENCY, Durability and Economy, with the Minimum of weight and Price.

These Engines are favorably known, a large number being in use on this coast, for hoisting, pumping, threshing, milling and mining purposes.

Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery and construction accounts saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Grist Mills

For sale by TREADWELL & CO.,
3v12-3m Corner of Front and Market streets.

Stevens' Pressure Packing.

Patented March 7th, 1865.

Pressure Packing is now conceded, by the best engineers, to be the most effectual method of making and keeping the metallic ring of pistons steam tight.

STEVENS' PACKING has the advantage of being cheaper to first cost than the ordinary packing, and can be applied to old style pistons with very little alteration or detention. Duplicates of testimonials, the Patentee requests of those who are using the cost spring packing to inquire of the owners of the various engines which now have this packing in use—some of which have been running from three to twelve months without being opened, or showing any descriptive leak—and act upon their recommendation.

Further particulars can be had by applying to the Patentee, ANDREW STEVENS, Master Mechanic, Alameda Railroad, or at the VULCAN IRON WORKS, where they can be seen, at any time, in course of construction.

10tf ANDREW STEVENS.

FOR SALE!
A STEAM ENGINE!
18 INCH CYLINDER, FOUR-FOOT STROKE, IN PERFECT Order. Can be seen running at the San Francisco Pioneer Woolen Factory, Black Point. Inquire at VULCAN IRON WORKS, 137 and 139 First street, or to
HEYNEMANN & CO.,
26v11tf 311 and 313 California street.

WATER WHEELS!

Equal to the Best Overshot Wheel

POWER PLEDGED IN EXISTENCE.

LEFFEL'S
AMERICAN DOUBLE TURBINE

Is now manufactured by the Vulcan Iron Works Company, in Sacramento, and orders for the same can be filled immediately. We have a large supply of the different sizes from 10 inches to 30½. That we may know the proper sized Wheel you require, measure your water in the following way: Take the width of the stream, the average depth and the distance it flows in a minute.

All the Wheels already in use give universal satisfaction. For particulars send for a Circular.

This Wheel is especially adapted to mining purposes. It is light, and can be easily packed into the mountains. Wheels weighing from 100 to 300 pounds, will yield from 10 to 40 horse-power under a head of 25 or 30 feet. They are the cheapest wheel to set up known, as they are so arranged as to produce the greatest power possible from the water used.

Come and see them, or send for a Circular to

LEFFEL & MYERS,
At Vulcan Iron Works, office 137 and 139 First street, San Francisco. 4v11tf

VARNEY'S
PATENT AMALGAMATOR,
These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow, between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the PACIFIC FOUNDRY,
1v1 San Francisco.

Prater's Patent Concentrator,
(Known as HUNGERFORD & PRATER'S Concentrator,)
MANUFACTURED AT THE
San Francisco Foundry and Steam Engine Works.
Corner Fremont and Mission Streets.
All orders promptly attended to.
2v12 DEVOE, DINSMORE & CO.

HUNT'S PATENT
Circular Sweep Horse-Powers,

For Planing, Churns, Washing Machines, Grindstones, pumping water, sawing wood, and other light machinery. Price, $100, at the Factory.

HUNT'S PATENT SELF-REGULATING TREAD HORSE-POWER is superior to any machine of the kind in the market. Price, with Governor, all complete to set to work, at the Factory, $300. Manufactured by

E. O. HUNT,
7v10 28 Second street, San Francisco.

Important to Miners.

NEW PATENT ROASTING PROCESS.

I AM NOW PREPARED TO OFFER TO THE MINING community a New Roasting Process, which has been approved as novel and beneficial by the best authorities in Europe. A Furnace can be erected in a few days at a trifling expense, and one man is able to Roast ten tons of Ore or Concentrated Sulphurets per day.

MORE COMPLETELY AND CHEAPER

Than any other Process. All the Sulphur is saved, by being converted into Bisulphide of Carbon, which is a valuable product, and will pay nearly all expenses.

For particulars, apply to

J. MOSHEIMER,
26v11-3m 423 Washington street.

SALMON'S
PROPELLOR AMALGAMATOR
—AND—
Challenge Settler

Has been in use and thoroughly tested, both in California and Nevada, with entire satisfaction to all parties concerned. These Machines are

Made entirely different from any others,

And with the same power will grind, amalgamate, settle and separate more gold and silver ore than any others now in use. Manufactured at the SAN FRANCISCO FOUNDRY where Machines can be seen in operation. Address

9v11 J. & W. C. SALMON.

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

NEW! NOVEL! USEFUL!
INDISPENSABLE!

BROCKWAY'S

PERPETUAL CALENDAR

Shows without hesitation

The Date or Day of the Week,

—OR—

Any Day or Date in the 19th Century,

Rendering it a prompt and accurate

ASSISTANT RECKONER,

Besides answering fully
And Conveniently
All the Purposes of the
Ordinary Counting-House Calendar
During the Nineteenth Century.

The Calendar for each month is arranged in a single column, as in the regularly published (book) Almanacs, rendering it more easy for reckoning, in most instances, than the customary Counting-House form of Calendars.

It is simply understood.
It affords the same reference from year to year.
It avoids errors.
It occupies a convenient space.
Its usefulness increases by use.
Once used it becomes indispensable,
It is worth one hundred times its cost.

Its cost is trifling, but its value is constant and perpetual. For a single reference it is often worth ten times its cost. In FINANCIAL, LEGAL and BUSINESS transactions, it saves many grave and important mistakes.

1852 1866

A NEW VOLUME.

Fourteenth Year of Publication.

THE GOLDEN ERA.

FOUNDED IN 1852.

The oldest weekly paper in the State, permanently established, and more widely circulated at home and abroad, than any other paper on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents and contributors of distinguished ability in New York, Paris and Loudon.

Miss BRADDON'S greatest Sensation Story, published from advance sheets:

RUPERT GODWIN;

—OR—

THE SECRET OF WILMINDON HALL.

A NOVEL.—BY MISS M. E. BRADDON,

Author of "Lady Audley's Secret," "The Outcasts," "The Doctor's Wife," "Three Times Dead," etc.

—IN—

THE GOLDEN ERA.

NOW IS THE TIME TO SUBSCRIBE!

Opinions of the Press:

THE GOLDEN ERA.—We would call the attention of all newly-arrived Californians to this excellent weekly cotemporary. We have seen the Era so frequently at the family fireside, and in the rude cabins of many industrious miners, that it would seem superfluous to recommend it to old Californians. It is the oldest literary journal on the coast.—[S. F. Mining and Scientific Press.

THE GOLDEN ERA, which has just entered upon its fourteenth volume, is fully entitled to be considered as THE literary paper of the Pacific coast. Its proprietors understand the wants of the community, and furnish their readers with all the popular works of fiction as fast as the proof sheets are received from the Eastern States and Europe, and with a greater variety of original matter in the line of light literature, than can be found in any similar paper on the continent.—[S. F. Alta California.

THE GOLDEN ERA has entered upon its fourteenth year of publication. How many competitors for public favor have been started during this time, and not possessing the freshness and originality of the GOLDEN ERA, have struggled through a short, sickly existence—at last to "flicker out"—almost unnoticed. No single paper in the State is more read and admired, and friends in the States appreciate it fully as highly as the thousands here who weekly scan its columns. It is no copyist, being in all its main features Californian, and unlike the "story papers" in general, its contents are interesting to all who take an interest in the literature of this coast.—[Napa Reporter.

THE GOLDEN ERA, as a good family paper, as a literary production, cannot be surpassed within the limits of America, and America beats the world in publication of first-rate literary papers. It is filled to overflowing with excellent reading matter, original and selected prose and poetry. It is now publishing, from advance sheets furnished from New York, two very interesting stories, each chapter of which is alone worth the subscription price of the GOLDEN ERA.—[Folsom Telegraph.

THE GOLDEN ERA is decidedly the best journal of the kind on this coast, and, we had almost said, in the United States. It is prepared with great care and labor, and publishes an immense amount of reading matter. The serial stories of the best authors are printed in its columns, and its local gossip is always pungent, racy and instructive.—[S. F. Examiner.

THE GOLDEN ERA is one of the best journals of its class in the whole country, and is carefully and intelligently conducted.—[S. F. American Flag.

THE GOLDEN ERA is enlarged by the addition of eight columns of reading matter. It was never more worthy the support of the reading public than at present.—[S. F. Morning Call.

THE GOLDEN ERA is decidedly the best family paper published in the State, and we are pleased to learn that it is in a flourishing condition.—[Sacramento Bee.

THE GOLDEN ERA, as a strictly literary and news paper, is chief among the best. Its correspondence and editorials are of that originality of style so peculiar to this coast.—[Oregon Sentinel.

THE GOLDEN ERA is the best literary paper published on this coast. It abounds in stories both real and fictitious, which are worth a careful perusal by every one.—[Santa Cruz Sentinel.

THE GOLDEN ERA is as good a literary paper as can be procured on the continent.—[Red Bluff Independent.

THE GOLDEN ERA has entered upon its fourteenth volume. It is by far the best literary and family paper ever published on this coast.—[Sonoma Democrat.

THE GOLDEN ERA is a most ably conducted literary journal, in every way worthy of its large circulation, and characterized by a flow of wit and freshness of satire in dealing with the prominent follies of the age that is truly refreshing.—[Deseret News, Salt Lake City.

THE GOLDEN ERA is a fine family and literary paper, as the broad Union anywhere can boast of.—[Denver Rocky Mountain News.

THE GOLDEN ERA is the best family journal in the United States.—[Salt Lake City Telegraph.

THE GOLDEN ERA is a highly handsome quarto of fifty-six columns, comprising the freshest and the richest cream of American belles lettres. Nothing north or south, or east or west, can be compared to it as an elegant family and literary newspaper.—[Union Vedette, Salt Lake City.

THE GOLDEN ERA, instead of economizing during these dull times and presenting a paper to match the times, is as brilliant as ever. It has a talented corps of literateurs, and keeps fully up to the mark.—[S. F. Dramatic Chron.

THE GOLDEN ERA is now in its fourteenth year of publication, and is established on a firm basis. It has a larger number of regular contributors, and gives a greater variety of reading matter than any other paper of the kind published in San Francisco.—[Quincy Union.

THE GOLDEN ERA has commenced its fourteenth year with a steady improvement in literary and typographical appearance.—[Yreka Journal.

THE GOLDEN ERA began in the infancy of the State, and has grown with it, until there is now hardly a post office in the State, or on this coast, where it is not taken. It employs the best writers in the Atlantic States, in Europe, and in California.—[Colusa Sun.

New Mining and Other Advertisements, etc.

THE MECHANICS' INSTITUTE.—The approaching election of officers for the Mechanics' Institute appears to be attracting much interest. The election is one of considerable importance. The question of the enlargement of the Institute, the acquisition of a cabinet, enlargement of library, establishment of a lecture system, etc., are matters which will come before the new board of officers; and the election of candidates should be made with a view to the proper accomplishment of these purposes. We gave the name of the candidates of the regular ticket in our last issue. A call has been issued for a meeting of those members favoring an Opposition Ticket, at the rooms of the Institute, this Saturday evening at 8 o'clock, for the purpose of appointing a Committee to select candidates to fill the various offices of the Institute for the ensuing year.

THE BATOPILAS MINE.—By the politeness of Mr. A. Martinon, we are permitted to lay before our readers to-day a portion of an interesting report descriptive of one of the richest mining districts of Mexico, in the State of Chihuahua. The report contains many facts which we are sure will be read with satisfaction by those interested in mining, and we shall continue its publication in future numbers.

ANOTHER CEMENT MILL.—Mr. Thomas McAuley leaves the city by to-day's up-river steamer, for the purpose of putting up another mill for working cement, similar to the one constructed under his direction at French Corral, and noticed by us a few weeks since. The present mill will be erected for Mr. M. J. Hydcliff at Red Dog, and will consist of ten stamps, to be driven by a hurdy-gurdy wheel, attached directly to the cam shaft. The machinery has been constructed at the Miners' Foundry.

COPPER IN ANIMAL TISSUE.—A distinguished chemist of Hamburg, after numerous and careful experiments has discovered traces of copper, and in some cases lead, in the remains of animals. He has found copper and lead in human flesh, and copper in the intestines of beasts of prey, in beef, in poultry, in hen's eggs, in fish, crustacea, insects, spiders, and snails.

ANCIENT WATERFALLS.—The women of Ninevah and Assyria, three thousand years ago, dressed their hair precisely in the style of 1865, with "waterfalls." The fact is proved by works of art in sculpture, still well preserved

IN our next will appear an interesting article on the subject of electricity. Also, one of the most accurate descriptions yet written of the State Capital buildings at Sacramento.

A NEW CORPORATION BILL.

Hon. Henry Robinson introduced in the State Senate, on Tuesday last, one of the most important bills of the session, relating to the levying and collection of assessments upon the capital stock of incorporated companies. The bill was referred to the Committee on Corporations, and ordered printed. A copy of the same will be found in another portion of this paper. Probably no law on our Statutes, passed with as good intentions, has been found more difficult in practice than the "Act Concerning Assessments on Corporations," approved April 4th, 1864, and there can be no real friend of the mining interest, who has experienced the effects of its narrow and arbitrary provisions, but who will favor the wholesome changes suggested by the new bill.

Mr. Robinson's bill appears to be offered as a substitute for the old law, probably to avoid the injudicious multiplicity of acts upon the same subject. It retains a similar course of proceedings, but on a more liberal scale, equally guarded for the interests of stockholders

The additional features of Senator Robinson's bill permits the corporation to purchase its own stock when outside parties do not bid sufficient to pay the amount due for assessments—a just provision, and often necessary to the progress of the work and operations of a company. It also requires a plaintiff, who claims that his stock has been illegally sold for delinquent assessments, to come forward and offer to pay the amount expended by the purchaser, and commence his action within six months of the date of the alleged illegal sale. No objections can be made to so reasonable a demand upon a claimant.

An amendment is made in Section 4 for the purpose of giving longer time for advertising, *when desired*, to accommodate companies owning claims in distant localities, as, for instance, Humboldt, Reese River, Los Angeles, Arizona, etc.; or companies who may have stockholders living at a great distance from both the mine and place of incorporation. It can work no harm to give *longer* notice, or *greater* length of time, to stockholders, provided the Board of Trustees, who have themselves to set the dates, deem it judicious. In fact, we would advise a wider limit of time than the new bill proposes.

The new bill does away with the necessity of appointing one certain day for advertising the delinquent sale—a requisition which has cost Secretaries great trouble, and oftentimes the companies much extra expense, in re-advertising, on account of failure to insert the advertisements upon the appointed day at both the mine and the place of incorporation. When the place of business and the location of the mine happen to be situated in separate interior counties, it is liable to occur that no paper is issued at both places on the same day where advertising is required. By the appointment of a day for advertising delinquent stock, as provided for in the old law, no chance is given to hear from the superintendent of the mine, or other parties who may, as agents, be receiving money on assessments, before the delinquent list has to be made out and forwarded for publication in the interior. In fact, in order to meet the requirements of the law of 1864, Secretaries in San Francisco are forced to make up their lists from one to three weeks in advance, to send to Reese River and other outer districts, inserting often the names of parties in this city, who are almost certain to come forward and pay their assessments before the advertisement issues, although their payments will be made too late to have their names withdrawn from the delinquent list. The new bill retains the wise provision that the day of sale shall be published in the first, or assessment notice, and while it does not shorten the term of publication of either of the assessment or sale notice, it allows both to be extended. The time for which postponements may be once made is extended to thirty days.

We have had much experience with the workings of the old law. It is very onerous to all parties interested. We think the new Senate bill a very judicious one, and hope it will speedily pass.

OPENING CEREMONIES.—The opening ceremonies of the Mining and Metallurgical Department, connected with the City College, corner of Stockton and Geary streets, took place last evening, in the Philosophical Room connected with the College. A large number of the pupils and friends of the Institution were present—more than were able to secure seats. Appropriate addresses were made by Mr. Veeder, the Principal of the Institution; Prof. Price, of the Chemical and Metallurgical department, H. P. Coon, Esq., Mayor of the city, Dr. Gibbons, and others. The addresses were all happy and appropriate in their character. Professor Price spoke at considerable length, giving the plan and object of his especial department. Mayor Coon prefaced his remarks with a handsome compliment to the MINING AND SCIENTIFIC PRESS, its usefulness, etc., and read the description of the laboratory, which was given in our last number. We regret that want of space will not admit of a fuller notice of the remarks of these and other gentlemen. A free course of lectures on general and practical chemistry was announced, to be delivered by Prof. Price, at the College. The lectures will be delivered every Tuesday evening; the friends of the Institution and of Education generally, are invited to attend.

LECTURES ON MINING AND AGRICULTURE.—We have received an announcement of courses of lectures upon Chemistry, Geology and Mining, to be delivered in the Department of Science of the College of California. The introductory lecture upon "Science and Scientific Schools, in their Relation to Mining Agriculture and the Kindred Arts," was delivered by Prof. Blake, on Tuesday evening last, in the College chapel, Oakland. The Chemical lectures are now in progress, and we intend to give some notice of them, and of the general course of instruction, next week.

COLORADO'S new Senators went to Washington under the instructions to labor for the change of the main line of the Pacific Railroad, so that it shall go through Denver and the center of population and development in that State, and over the Rocky Mountains by the Berthond Pass.

ROASTING PROCESSES.

EDITORS MINING AND SCIENTIFIC PRESS: In your issue of February 10th, I notice an article, under the title of "Roasting of Sulphurets," which is signed "W. H. Munning." I have no acquaintance with the writer, and have no recollection of ever hearing his name mentioned, and should take no notice of his communication were it not for the fact that he has taken occasion to make use of my name in a deprecatory manner, in introducing to the world an invention of his own for roasting sulphurets. He commences his communication by condemning my process; remarking at the same time that he does not care to point out its defects. Did Mr. Manning ever try my process? If not, why does he attempt to introduce himself to the world, as an inventor by condemning another, about which he knows little or nothing? If Mr. M. has anything to offer to the public, why does he not give it direct, and allow it to stand or fall upon its own merits, instead of attempting to build it up by an attack upon my process.

Perhaps Mr. M. may be as ignorant of what his own furnace can do as he appears to be of mine. What quantity of sulphurets has he ever worked by his process; and how much has it cost him per ton? How much gold and silver does he leave in the ore? These would be important questions for him to inform us upon in connection with his process. Mr. M. calls me to account for remarking that there is no cheap process known for desulphurizing, and appears to think that I should have known of his own. He will please excuse me for not having previously made his acquaintance.

Roasting ore is not as easy a process as that of roasting beef. If we apply heat to the beef, it gets cooked; but no matter how much heat we apply to ores, although we can smelt them, still we cannot get all the sulphur from them by an ordinary heat, with free access of air; the sulphur will sooner melt with the metal than leave them. The old doctrine is, give your ore plenty of air, and you roast well and quick; I say, exclude the air and not half the heat is required. Let any one try it for himself by using either pipes, retorts or crucibles; heat both in the same fire, charged with the same ore—one open and the other closed—and you will find that the ore in the closed retort will be done in much less time than the ore in the open retort.

J. MOSHEIMER.

IMPORTANT PURCHASE — CORRECTION.—The Nevada papers, in making mention of the purchase of the Cambridge mine, in Grass Valley, have erred with reference to the amount paid for the same. Thirty, instead of twenty thousand dollars, is the consideration given. The purchase has been made by Messrs. Cronise & Co., and cannot fail to turn out an excellent investment. The mine is an extension of the well-known "Lucky Mine." The same parties have also purchased the Jefferson mine for $18,000, and the whole property has been divided into sixteen shares of $3,000 each. A contract for the erection of a mill has already been entered into, to be completed in sixty days. Ten stamps will be put up at first, with a power sufficient to drive twenty, as soon as that addition may be needed.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

THE TRACTORY CURVE, AND THE PROPERTIES OF GRINDING PLATES.

BY W. A. GOODYEAR.

[CONTINUED FROM PAGE 98.]

Let us now determine whether the curve is convex or concave towards the two axes. Before we can do this with respect to the axis of y, it will be necessary to determine the real sign of x, or, since $\frac{a-\sqrt{a^2-y^2}}{a+\sqrt{a^2-y^2}}$ is always less than unity, and its logarithm is therefore always negative, to determine the *relative* values of $\sqrt{a^2-y^2}$ and $\frac{a}{2}\log_e\frac{a-\sqrt{a^2-y^2}}{a+\sqrt{a^2-y^2}}$. To do this, put again $\sqrt{a^2-y^2}=z$, and

$$\frac{a}{2}\log_e\frac{a-\sqrt{a^2-y^2}}{a+\sqrt{a^2-y^2}}=u, \text{ thus}$$

(19) $u=\frac{a}{2}\log_e\frac{a-z}{a+z}$. Therefore, differentiating now with respect to z,

(20) $\frac{du}{dz}=-\frac{a^2}{a^2-z^2}$, Equation (20) shows not only that u is a decreasing function of z, but since $\frac{a^2}{a^2-z^2}$ is always *greater* than unity, it also shows that u always decreases *faster* than z increases. Now, since when $y=\pm a$, (which numerical value it can *never* exceed), both z and u are $=0$, and when y diminishes numerically, u *always* decreases faster than z increases, it follows that if, as in (16), we take the upper sign in equation (18), x is always negative, and if, as in (17), we take the lower sign in equation (18), x is always positive.

We can now determine the convexity or concavity of the curve towards the axes.

If $x\frac{d^2x}{dy^2}$ is positive, the curve is convex towards the axis of y; if negative, it is concave. The same conditions hold with respect to y $\frac{d^2y}{dx^2}$ and the axis of x.

Now, from (3), $\frac{dx}{dy}=\pm\frac{\sqrt{a^2-y^2}}{y}$, therefore

(21) $\frac{d^2x}{dy^2}=\mp\frac{a^2}{y^2\sqrt{a^2-y^2}}$. If we take upper sign here, and therefore the upper sign also in (18), both x and $\frac{d^2x}{dy^2}$ are negative. If we take the lower signs, x and $\frac{d^2x}{dy^2}$ are both positive. $x\frac{d^2x}{dy^2}$ is, therefore, always positive, and the curve is always *convex* towards the axis of y.

From (3), $\frac{dx}{dy}=\pm\frac{\sqrt{a^2-y^2}}{y}$, therefore,

(22) $\frac{dy}{dx}=\pm\frac{y}{\sqrt{a^2-y^2}}$. Put this $=u'$, then $\frac{d^2y}{dx^2}=\frac{du'}{dx}=\frac{du'}{dy}\times\frac{dy}{dx}$. Therefore

(23) $\frac{d^2y}{dx^2}=\frac{a^2y}{(a^2-y^2)^2}$, and

(24) $y\frac{d^2y}{dx^2}=\frac{a^2y^2}{(a^2-y^2)^2}$. This, being a perfect square, is always positive. Hence, the curve is always convex towards the axis of x.

When $y=0$, $x=\pm\infty$, and $\frac{dy}{dx}=0$. The axis of x is therefore an asymptote to the curve in both directions.

The above conditions are sufficient to give us an idea of the general form of the curve, which has four similar and equal branches—one in each of the four angles formed by the axes.

From equation (18), tables may, of course, be easily calculated for constructing the curve if desired.

To find the length of the curve, denote the length of any portion of the curve by s. Then, to find s in terms of y, we have the general formula,

$\frac{ds}{dy}=\sqrt{1+\left(\frac{dx}{dy}\right)^2}$; Hence,

(25) $\frac{ds}{dy}=\sqrt{1+\frac{a^2-y^2}{y^2}}=\pm\frac{a}{y}$

Integrating (25), we have

(26) $s=\pm a\log_e y+C$. If we measure the length s, from the cusp as a starting point, then when $y=a$, $s=0$, and therefore $C=\mp a\log_e a$. Therefore,

(27) $s=\pm a(\log_e y-\log_e a),=\pm a\log_e\frac{y}{a}$. If we wish s to be positive, we must take the lower sign in (27), since $\log_e\frac{y}{a}$ is always negative, y being less than a. Equation (27) then becomes

(28) $s=-a\log_e\frac{y}{a}=a\log_e\frac{a}{y}$, which is always positive,

To find the area included between a branch of the curve and the axis of x.

Denote this area by A. The general formula is then $\frac{dA}{dx}=y$. But

$\frac{dA}{dy}=\frac{dA}{dx}\times\frac{dx}{dy}$. Therefore, in the tractory,

(29) $\frac{dA}{dy}=\sqrt{a^2-y^2}$. Integrating (29), we have,

(30) $A=\int\sqrt{a^2-y^2}\,dy=$

$$\frac{y}{2}\sqrt{a^2-y^2}+\frac{a^2}{2}\sin^{-1}\frac{y}{a}+C.$$

Taking the integral in (30) between the limits $y=0$ and $y=a$, we have for the whole area of one branch of the curve,

(31) $\int_0^a\sqrt{a^2-y^2}\,dy=\frac{\pi a^2}{4}$, which is equal to the quadrant of a circle whose radius is a. Since there are four equal branches, the total area of the curve equals a circle whose radius is a.

[To be Continued.]

In 1860 there were over eighty-two thousand miners in California, and only about twenty thousand farmers. The disproportion is, probably, not so great now; but mining is, and for many years must continue to be, the predominating industrial occupation of the people of this coast. Our manufacturing, commercial and agricultural interests are rapidly increasing in importance, but their future success and permanence depend almost entirely upon the mines. Shut off the market that the mining regions afford and the supply of the circulating medium that flows from them and the business of the State would in a very short time become completely paralyzed. The mines are unquestionably the primary source of whatever prosperity the State enjoys and anything looking to their further development should be encouraged by all classes.

The navigation of the Colorado river, is now fully established, giving facilities for opening and developing the gold, silver and copper mines of California and Arizona, thereby greatly increasing the value of the mining interests in that section.

Island Coal.—The Newport (R. I.) people are burning coal which is mined upon their island. It costs them $8.60 per ton.

The Chemical Action of Steam on Metallic Sulphurets (Schwefelmettale) at a High Temperature.

[Translated for the Mining and Scientific Press from the German of Carl Fredrick Plattner, (Die Metallurgischen Rastprozesse, Freiburg, 1856.]

BY G. W. BAKER.

[Continued from Page 99.]

The application of steam for the decomposition of metallic sulphurets, and at the same time winning the sulphur and sulphuric acid, in practical metallurgical operations, was first proposed by Rodgers, likewise by Rousseau.—*London Art Journal, August*, 1843, *p.* 7. *Dingler's polyt. Jour. Bd.* 89, *S.* 443. *Sowie Bergwerks freund, Bd. VII. S.* 109 *(L' Institute, durch polyt. Centralblatt.)*

Bergwerk's freund, Bd. VII. S. 109. *(L' Institute, durch polyt, Centralblatt.)*

Both of them were convinced that the employment of steam could be made practically useful with metallic sulphurets; first, for the complete conversion of the sulphurets into oxides, as is done in the ordinary atmospheric roasting; and, second, to condense the sulphurous acid evolved in leaden chambers, for the production of sulphuric acid, and afterwards successfully win the sulphur from the sulphureted hydrogen formed in the operation.

Cumenge undertook experiments concerning the employment of steam, chiefly for the separation of arseuic and antimony from their ores, and which, indeed, in a technical point of view, could be submitted to metallurgical treatment practically. Since this author, these experiments have yielded favorable results.—*Annal. des mines, Serie* 5, *Tom.* 1, *S.* 425; *auch Berg-und huetten m. Zeitung*, 1853, *S.* 561, 580 *etc.*

Patera, also, roasted the rich silver ores of Joachimsthaler, with favorable results, under the influence of steam. The apparatus which he at first employed, consisted of a muffle (without draft holes), the fore part of which was closed with a tile. Steam, obtained from a distillate, was conducted over the ore by means of a glass tube, and out by another tube, which connected the arch of the muffle with a series of Wolf's bottles for the condensation of the volatile products. These consisted of metallic arsenic, arsenious acid; some sulphur, with finely divided ore, was carried over by the current of steam. A small openiug was left in the stone closing the fore part of the muffle, easily closed with a clay stopper, and through which the operation could be observed and the ore introduced.—*Jarbuch der k. k. geolog. Reichsanstalt*, 5 *Jahrg. No.* 3, S. 611. *Berg-und hutten m. Zeitung*, 1855, *S.* 131. *Berwerks freund, Bd. XVIII. S.* 295.

Red Silver (Rothgiltigerz) was speedily reduced to metallic silver. An ore containing 18 marks of silver to the 100 pounds, or about 8.5 per cent., was completely freed from arsenic after five hours roasting. The reduced silver could he readily seen with the naked eye.

In order to separate the silver from the other metals, the greater part of which existed in the state of oxides, Patera employed with advantage a mixture of moderately diluted sulphuric acid and saltpeter, by which the silver, together with the oxides existing, and the salts, respectively, of nickel, cobalt, copper, bismuth and arsenic, were dissolved. The silver was precipitated out of its watery solution, as chloride of silver. This was reduced with the aid of a simple galvanic apparatus and smelted. The residue, after being well lixivated, contained only from 10 to 12 loth of silver to the 100 lbs., from an ore which originally held from 14 to 18 marks, and consisted of nearly 50 per cent. of the mineral subjected to treatment. The nickel, cobalt, copper and bismuth, could be easily recovered by ordinary methods.

Experiments on a somewhat larger scale, also in a muffle, simplifying the condensation of the volatile products of the roasting, prove that this mode of treatment might be employed with advantage for desilvering the rich ores of Joachimsthaler, in quantity, if they also contain other metals of value.

From the foregoing results, especially the designated trials, it follows:—That metallic sulphurets (which give off no sublimate of sulphur at a high temperature) in a glowing condition, excluding the air and treated with steam, are slowly decomposed by the gaseous products of the fuel used for their inflammation; that the sulphur of the mineral operated on, unites with a part of the hydrogen of the steam forming sulphureted hydrogen, which becomes free. The metal, if at a temperature sufficient for oxidation, unites with the oxygen disengaged from the steam; this oxide is easily reduced to metal, if it either remains at the highest stage of oxidation, or has the disposition to cede its oxygen to an equivalent portion of the sulphur of the remaining undecomposed sulphuret; that sulphurous acid is evolved, but which, when it encounters sulphureted hydrogen is decomposed by the latter, forming water and eliminating sulphur. Whenever the sulphuret is found to be at a higher or lower stage of sulphurization, and the metal more or less favorable to oxidation at a high temperature, there will then be evolved, besides sulphureted hydrogen, also a greater or less quantity of free hydrogen and sulphuric acid, sulphur vapor being freed. Such sulphurets will also give a sublimation of sulphur when air is not admitted, a part of the sulphur becoming free without votalization. If the sulphur abounding metal is of such a constitution that it possesses the disposition to decompose water, or its oxide is, as per example, the oxides of iron and of copper, inclined to cede its oxygen easily to sulphur, it will remain at a lower stage of oxidation, iron as a suhoxide and copper as a suhoxide of copper; but if it is not at all favorable for taking up oxygen at a high heat, or retains it fixed in greater quantity, it will be remain in a metallic condition; as for example: Silver, which, when it, under certain conditions, takes up some oxygen, easily parts with it again. When the sulphurets are such as form volatile oxides, origiuating oxysulphurets, they are removed, as is the case especially with those of antimonial and arsenical sulphurets.

The results are different when sulphurets are decomposed under the influence of steam, admitting free access to the air; acting, too, in the presence of the gases formed by the burning fuel, which invariably holds free oxygen. It is true that steam will act as has been already stated; but at the same time the oxygen of the air will operate, and hence the sulphuret will be oxidized through these agencies more speedily and much easier. Whilst sulphureted hydrogen is formed through the decomposition of the sulphuret by steam, the sulphur will also be burnt and volatalized. More sulphurous acid is formed, which, by catalysis, will in part be converted into sulphuric acid, and the oxide formed from the sulphurets will not only be brought to a higher stage of oxidation, but it will also give rise to sulphates of the metals, which will remain partially or wholly unaltered, being difficult of decomposition, unless at a higher temperature. The more constantly air has opportunity to act with steam on red hot sulphurets, so much the more nearly will the roasting approach that of the ordinary roasting in the absence of steam, and hence at least the purpose of separating the sulphur as nearly complete as possible, will he attained.

Since the experiments in the laboratory demonstrate, also, that the decomposition of sulphurets by the employment of steam in the absence of air, can only be accomplished at a higher, and, indeed, in most cases, at a much higher heat than that required in the ordinary roasting, admitting the air, is a circumstance with regard to the consumption of fuel, which, at least here, is worthy of great consideration. When, again, it is further considered that the decomposition of sulphurets by steam, in the absence of air, requires a much longer time than the ordinary roasting with air, even if at no greater cost of fuel, added to the increased cost of labor per quintal of ore, it will be comprehended that the roasting of metallic sulphurets, under the influence of steam, can be resorted to with advantage only in certain cases, as for instance: Where a separation of sulphur, arsenic and antimony, as completely as possible, is proposed; or when, in the roasting of rich silver ores, the loss of silver by volatalization should he avoided.

Up to the present time, so far as is known to me, the application of steam in large roasting processes, has been found applicable entirely and chiefly only in shaft furnaces for iron ore, iron pyrites, arsenical pyrites, and other mixed metallic sulphurets, such as copper pyrites and copper stone. Patera has, it is true, decomposed rich silver ore by steam, and hence, in that respect, has paved the way for larger operations with advantage.

The first experiment in roasting iron ore under the influence of steam, was undertaken, as already alluded to, in the year 1843, in Russian-Finland, at the iron works of Dalsbruck, under the direction of Nordenjold. The desired results having been attained, this method was introduced, not only in Finland, but also in the mountains of the Ural; and since then in many other places this practice has been followed with like favorable results.

Iron ore, in not very large pieces, put in a shaft furnace, should he so heated by the flame of wood beneath the supply of steam, that as little undecomposed air as possible enters the furnace with it, and the iron ore should he of a constitution such as will, through the bare heating to a red heat, acquire such a porosity as to make it penetrable to the center by the gaseous products of the fuel admitted, commingled with steam; it is to be understood, also, that the intermingled sulphurets, and sulpho-arsenical-pyrites, shall he retained in the heat sufficiently long to he decomposed, and the metal bound up in sulphur and arsenic to be

completely changed into oxides, as by the ordinary roasting without the application of steam. There are, however, ores so dense that they do not become porous by heat, as, for instance, is the case with magnetic and ologestic iron ore; or, if the ore is treated in large pieces, the success will not be so favorable as desired.

Although wood and gas from shaft furnaces, or inflammable gas, specially generated, are best adapted for a proper roasting, since they yield no fuliginous flame, yet occasionally good coal may be serviceably employed.

At iron works where the shaft furnaces are worked with charcoal, producing a large amount of very fine coal dust, the latter is utilized in roasting furnaces as fuel for the ordinary roasting, by stratifying it with the ore. It is also sometimes used in shaft furnaces arranged for flame firing, besides the burning fuel, when at the same time steam is admitted to the ore chamber. When, also, by this means it is proposed to maintain the ore at a high temperature, that object will be gained in part, but at the expense of the following mischief, viz: The coal dust fills up the interstices in the layers of ore, not only interrupting the draft, but the coal will decompose one part of the steam, forming thereby, besides a small quantity of carbonic acid gas, a considerable quantity of carbonic oxide, and also a still greater quantity of hydrogen; of which gases the first and second have no influence, and the latter only a feeble influence on the sulphuret. The steam, which has already intermingled exteriorly with the gaseous products of the fuel, being again dilated with other gases, penetrates the pores of the ore very feebly.

A similar result would happen when Kohlen eisenstein (an ore found in coal formation), which sometimes contains thirteen per cent. of carbon, is submitted in roasting to the action of steam.

In the mountains of Altai, cupriferous sulphurets and copper matt, holding about forty-five per cent. of copper, are roasted in shaft furnaces with steam, whereby a saving is made on the ordinary roasting in stalls, especially if the matt requires much flame, not only in time, but also in fuel, and afterwards by smelting the roasted matt, crude copper is obtained freer, especially from antimony, than when the roasting is done in stalls.

From Our Regular Correspondent.

THE VOLCANO DISTRICT.

The morning of the 29th found me at Volcano, enjoying the good cheer of the St. George, in company with my friends Fenton of Enterprise City, and Perkins of Amador, with whom I had come up from Amador City on the day before.

The village of Volcano lies in a deep valley formed by the junction of three branches of Sutter Creek, which, united, flow through a narrow gorge to the westward, a wall being built across which would make the finest reservoir in the world; as a wall 500 feet in length could be made to give an average depth of 100 feet to the water covering a thousand acres! The placer mines of Volcano, like most of those of California, have seen their palmy days; still, however, an active business is done in the way of derrick-mining—lifting the gravel from basins which are too low to be washed in the ordinary way, in tubs suspended to derricks worked by horse or steam power, to boxes placed at a convenient hight for washing.

I spent the day, after breakfast, in visiting the quartz mines of the district, which are now beginning to attract great interest. I paid my first visit to the mill of S. C. Fogus & Co., situated on Sutter Creek, one and a half miles below Volcano. The mill, of ten stamps, is well built; but as the site is subject to overflow from the creek, it is the intention of Mr. Fogus to move it higher up on the bank, should the further development of the mines justify the erection of more machinery. The mill is driven by water, which is abundant the year round. The company own four ledges, the principal of which is the

WHITMORE AND MONDAY,

Of which they claim 4,200 feet. It has been opened at various places, within these limits, but to no great depth at any given point, the deepest shaft being eighty feet. A tunnel is driven in on the ledge near the north end of the claim, a distance of 200 feet. It is intended to connect this with the principal shaft, which will require it to be run 700 feet further, and the shaft to be sunk to a depth of between two and three hundred feet. The present workings show a bold, well defined ledge, running north and south, with a dip of forty-five degrees to the westward, and from four to six feet wide. The rock worked at the mill has thus far paid from ten to thirty dollars per ton.

On leaving the mill, Mr. Fogus rode out with me to visit

THE CONFIDENCE,

Lately purchased from the discoverers, by San Francisco capitalists, for, I believe, $20,000. It is being managed for the owners by Mr. Tulloch, one of the oldest prospectors of Volcano. The course of the ledge is north and south, and its dip nearly vertical. One shaft has been sunk to a depth of ninety feet without striking water, developing a ledge with an average width of two and a half feet. Since it came into the present hands none of the best rock has been worked, but of the "refuse," as it is called by the miners, a few tons have been crushed at Fogus & Co.'s mill, and yielded about ten dollars per ton.

THE GOLDEN GATE MINE AND MILL,

Are located three miles above Volcano, on the North Branch of Sutter Creek. The vein has been prospected only to a depth of thirty-four feet, but has thus far proved very rich. It is located in a slate formation, and lies in a north and south direction, with a dip of forty degrees to the eastward. The mill is of ten stamps, very well built, and with wheel for winter, and steam engine for summer use. Two of Knox & Guiod's, and two of Knox's pans are used. The quartz has heretofore paid about forty dollars per ton.

From the Golden Gate I rode to

THE PIONEER,

Situated about four miles above Volcano, on another branch of Sutter Creek. As it was now too late to return to Volcano over the breakneck path by which I had come, I accepted the generous hospitality of the superintendent, Mr. Ambler, and spent the night. After an early breakfast I went with Mr. A. to look at the mine. The ledge is in a granite formation, its strike being nearly northwest and southeast, and its dip nearly vertical. The rock is the richest in sulphurets that I ever saw. The tunnel through which the ledge has been worked heretofore was obstructed by water from the recent rains, so that we could not pass through the mine, but the large amount of ore lying outside the mouth of the tunnel showed conclusively the character of the vein. Its width is from sixteen to twenty inches, and such of the quartz as has been tested by processes capable of separating the gold from the sulphurets, has yielded from $50 to $100 per ton. Since the purchase of the property by the present owners, (Messrs Meader & Ambler), measures have been taken to open it in excellent style. A shaft, eight by ten feet in the clear, with four compartments, expected to connect with the tunnel at a depth of 108 feet, has been sunk to a depth of eighty feet, and is still being carried on with vigor. A fine boarding house is in course of erection, and a 5-stamp water-mill with amalgamators and concentrators, was almost ready to start. I was accompanied back to Volcano by Mr. Ambler, who was on his way to Pine Grove. Passing through Volcano I came on to

THE SORACCO MINE,

Located two miles below Volcano, on a branch of Sutter Creek. This mine, which I noticed more at length in my letter from Rich Gulch, last April, has been more thoroughly explored and promises to be one of the best in Amador county. It is now said to be owned by Col. Rogers, who is at present in New York. It was purchased from the original owners, the Soracco Bros., and McLane, by Mr. A. H. Rose, former owner of the Keystone mine at Amador City, it is said, for $56,000. It has been opened to a depth of 225 feet, and by tunnels horizontally a distance of 800 feet, showing an average width of thirty inches. The quartz is said to have yielded an average of $25 per ton, though the mill, of ten stamps, driven by water power, is rather a poor thing. Here I fell in with my friend Fenton, whom I had left in Volcano on the previous afternoon, and in his company visited the Harvey and Aorta ledges, after which we returned to Amador City, arriving late, tired and hungry, but on the whole well pleased with our trip.

THE HARVEY

Is owned by Messrs. Grundy and Harvey, and has only been opened to a depth of about forty feet, the owners having been embarrassed by want of capital. The ledge is from three to five feet wide, and I was informed by Mr. Grundy that 100 tons, which had been worked, had paid from sixteen to eighteen dollars per ton. The owners are erecting steam hoisting works, which they expected to start in about a week, which would enable them to develop their mine to better advantage. Another claim is being opened on the same ledge by the former owners of the Soracco, with encouraging prospects of success.

THE AORTA

is situated near Pine Grove, and is claimed by Messrs. Barron, Ames and Fike. It has been opened by a shaft to a depth of sixty feet, and drifts have been run each a distance of 150 feet. I was informed by Mr. Barron that some 200 tons had been worked with an average yield of $35 per ton. The ledge is from one to two feet in width, its general course being nearly north and south.

After leaving the Aorta we made a flying call at the Tellurium mill, where we saw some very fine rock, but were prevented from making very extended observations for want of time.

Yours etc. D.

[Written for the Mining and Scientific Press.]

"Gold Bearing Sulphurets and their Reduction."

MESSRS. EDITORS:—I have noticed in your late issues an advertisement signed "J. Mosheimer," in which he offers the mining community a "New Patent Roasting Process," for for ronsting ore or concentrated sulphurets (of iron?). I should not take any notice of the advertisement in question, were it not that the process advertised is a portion of an invention of my own; at least, I honestly believe that I am the inventor of it. It was matured by me in the year 1858, and a full description of it lodged in the secret archives of the Patent Office, in the early part of 1859. The *portion* of it "adopted" by "J. Mosheimer" was confided to him by me in the month of April of the same year (1859); and was described in my communication to your journal of December 9th last. Mr. M. has applied for, and lately obtained, a patent for it from the United States Government. As my invention has now become public property, and is not patentable, I will proceed to lay before your readers, and the public in general, a description of the *whole* of the process, as follows:

I take the sulphurets, seleniurets, arseniurets, tellurets of iron, etc., mixed or not with other mineral substances or compounds, and expose them alone, or combined with carbon, liguine, or their equivalents, in tubes or retorts of fire-clay or other appropriate material (arranged vertically, horizontally, or inclined, in a furnace,) to a red heat; atmospheric air being excluded, till the greater portion of the arsenic and tellurium, and all the sulphur and selenium, in excess of a single equivalent, are expelled, either in a free state or in combination with carbon, leaving the gold and silver in combination with the resulting proto-sulphurets, none being lost or volatilized in the operation. The carbon or its equivalents is used to form bisulphuret of carbon with the excess of sulphur, and thereby avoid loss of gold; and also to act mechanically by increasing the porosity of the mass and its permeability by vapors, and to diminish the liability to fusion and coalescence of the proto-sulphurets.

I then take these proto-sulphurets and mix them with chlorides, iodides, bromides or fluorides, of the fixed alkalies or alkaline earths, or other neutral salts, fusible and irreducible by carbon at a red heat, in such proportions as to form a *magma*, when raised to a temperature about 1,000° Fahr., of a proper consistence for grinding. To this mass I add sufficient pulverized metallic lead or bismuth, litharge, or ceruse, etc., to absorb all the precious metals present, and also about five per cent. of carbon. I place the mixture, intimately commingled, in a convenient apparatus, such as a revolving cylinder or cast-iron arastra, covered with a dome for the more or less perfect exclusion of atmospheric oxygen and retention of evolved vapors, and having raised the temperature to from 1,000 to 1,500° Fahr., I continue mixing, stirring, grinding, or triturating the mass by means of discs, rakes, or other well-known implements, till the precious metals present shall be wholly or principally absorbed by, and alloyed with the lead or bismuth. I then remove the mass, separate the metallic granules by washing or otherwise, and extract the gold and silver in combination by cupellation or solution in acids.

Secondly—I propose passing aqueous vapor through or over the mineral compounds mentioned, mixed or not with carbon, lignine, or their equivalents, at a bright red heat in tubes, retorts, or other appropriate vessels (closed from the air), till the sulphur, selenium, tellurium, arsenic and kindred substances shall have been evolved, principally in combination with hydrogen—the oxygen of the water, combining with the iron, etc., present, whereby I obtain magnetic oxide of iron, containing all the gold and silver originally existing in the mineral. I then subject this compound ($Fe^3 O^4$) for the extraction of the precious metals, either to amalgamation in any suitable apparatus, for which I prefer the Mexican *tahona* or the Saxon barrel; or to triturntion with lead or bismuth, or their oxides, with carbon and fusible salts, at a high temperature; or, lastly, I dissolve and extract the metals with well-known solvents, as alkaline chlorides, and the hyposulphites and hypochlorites of the alkalies and alkaline earths.

Thirdly—I propose, instead of the vapor of water in the last process, passing chlorhydric acid gas over the ignited compounds, whereby by double decomposition I obtain sulphydric acid (which may be utilized in preparing sulphuric acid, bisulphite of lime, and other manufactures) and a mixture of the proto and per chlorides of iron, which partly volatilizes, and may be condensed by coke columns, or in other appropriate condensing apparatus, and partly remains mixed with the gangue and residuary matters from which it may be extracted by solution in water.

I propose peroxidizing these proto-chlorides, by exposure of their solutions to the air in shallow vats, by percolation through "graduation walls," or other well-known methods, and then to recover the hydrochloric acid by evaporation to dryness and distillation at a red heat, in retorts or cylinders fixed in a suitable furnace. From the mass remaining in the retort, after treatment with gaseous hydrochloric acid, I propose recovering the precious metals by any of the methods previously mentioned.

I do not claim the decomposition of pyritous matters at a red heat by roasting, in contact with air, or matters containing oxygen free to combine with the sulphur, etc., the same having been used from time immemorial. Nor do I claim the decomposition of pyritous matters at a red heat by aqueous vapor, with the intention of collecting the volatile products of the decomposition, the same having been known and practiced. Nor do I claim the treatment of bisulphurets and magnetic sulphurets, in closed vessels at a red heat alone, for the evolution and collection of sulphur; nor in admixture with carbon and carbonaceous substances for the production of the alcohol of Lampadius *(bisulphide of carbon)*, the same having been known and used. But I do claim having discovered that all pyritous and similar substances of an auriferous or argentiferous nature, being decomposed, or partly decomposed, by the processes given, the arsenic, sulphur, selenium, tellurium, and other elements inimical to the amalgamation and extraction of the valuable metals, may be partially or entirely eliminated and removed without any loss of the precious metals by volatilization or otherwise.

And I claim the process of decomposition of auriferous or argentiferous pyritous matters in the manner described, and with the apparatus (or other appropriate apparatus) indicated, with reference solely to the final isolation of the precious metals as the result sought to be obtained, irrespective of the economization of the sulphuret of carbon, sulphur, sulphydric acid, carburetted hydrogen, chlorides and oxides of iron and arsenic, or other incidental products of the decomposition. And I claim, furthermore, the driving off the excess of sulphur, selenium, arsenic, tellurium, antimony, etc., previous to the treatment of the auriferous and argentiferous minerals with lead, carbon, and fusible salts, in appropriate apparatus (preferably sealed to prevent the admission of atmospheric oxygen), substantially as set forth and above described.

JOHN SCOTT,
Metallurgical Chemist.

A STRANGE ANIMAL.—The Tuolumne *Courier* says that Mr. John Ede, lately caught at Chaparral Hill, in that county, a strange animal of the cat or feline species, which is thus described: "Its head and tail resemble a raccoon, to which its habits also assimilate when it wants to go to sleep. Its body somewhat resembles a weasel, its fore feet those of a cat, having the feline faculty of withdrawing its claws, and lastly its hind feet those of a fox. It was tolerably tame, and would allow its master to handle it very readily. Its color was a kind of rabbit-gray, excepting the tail, which was ringed precisely like a raccoon. Mr. Ede called it a civet cat, and others called it a mountain cat. Some twelve years ago, continues the *Courier*, we saw some similar animals on the Feather river, but the miners there had no name for them but the general one of wild cat. The Indians there called them 'chilli-chillin,' and said they were good to eat. They make excellent monsers when tamed."

RAPID TRAVELING.—In a grand race of the ice-boat fleet, which recently took place on the Hudson River, near Poughkeepsie, the Minnehaha, or winning boat, made ten miles in eight minutes time. This is at the rate of seventy-five miles an hour—pretty rapid traveling.

REPORT

ON THE

Mining District of BATOPILAS, in the State of CHIHUAHUA, MEXICO.

[Extracts from a work now in Press in the Mining and Scientific Press Job Printing Office.]

Among the number of celebrated mineral districts, that in former years yielded such fabulous wealth in silver and other precious metals,

BATOPILAS

ranked as one of the principal ones. *The history* of this place can with certainty be traced back about 200 years, although its greatest *splendor* appears to have been in the middle of the last century, when a number of its mines made it the envy of all Mexico.

A Mexican writer of note, *Don J. A. de Escudero*, in his very interesting "NOTICIAS ESTADISTICAS DEL ESTADO DE CHIHUAHUA," says that Batopilas paid the greater part of the sum of 922,000 marks of silver ($7,376,000) into the King's treasury at Chihuahua, passed by that office from the years 1785 to 1789, the only other mineral contribution being that of Parral,—this sum being the *Derecho del Rey* (King's dues) of 20 p ct. levied on the amount taken out of the mines, which must have yielded, in those five years, $36,880,000, besides what may have been secreted and stolen by the workmen and others.

It is, indeed, greatly to be regretedt that the conflagration of 1827 laid a large portion of the Capital of the State (the City of Chihuahua) in ashes, destroying the archives relating to the District of Batopilas. That misfortune has deprived us of the authentic facts, referring to the yield of each mine by itself. Very few old documeuts, however, yet remain scattered over the country in private hands.

More or less silver continued to flow from Batopilas until 1810 to 1812, epoch of the Mexican Declaration of Independence, when the district commenced to feel the consequences, until 1821, when the war had placed the country in a chaos of misery, and the Spaniards were expelled from it. This, at one blow, stopped all the works, and put an end to the long period of prosperity, gradually reducing Batopilas to a state of perfect staguation.

The huts and "*adobe*" houses fell in for want of care, aud lay in ruins, dilapidated and roofless; the few now remaining are scarcely in a better condition.

A few years afterwards, the celebrated district of "*Refugio*," in the same State, was discovered; a rush of the, as yet, remaining able workmen of Batopilas took place, and the district fell into the greatest misery. The extreme richness of the rubbish piles, the facilities of gaining a subsistence by picking them over, aud the hope of sometimes meeting with somethiug better worth their time, induced a scanty proportion of the former numerous population to remain. It is reported, that at one time it amounted to some 5,000; whereas, at present, it may not be over 600 souls.

It was only occasionally that any important discovery was made by these poor people, who hardly had a fit instrument to work with. Such induced then, momentorily, a revival, calling back from other places a share of former deserters, who did not know how to take advantage of their good luck, for the reason that as soon as acquired, was again expended; people essentially migratory, who would collect at first report of a "honanza," dispersing soon after, leaviug no trace of enterprise.

Besides a very few tolerably good houses, the small church, the remains of several reduction works, ("*Haciendas de beneficio*,") once moved by water, and a numher of others by horse or mule power, were, or rather are, the only remaining vestiges of its former opulence.

We must, however, take into consideration the general character of the inhabitants composing the population; the very limited communication that it had, for the reason of its isolated position, with the more civilized parts of the country, and the very few attractions it presents to persons to undertake costly huildings.

THE MOUNTAINS,

that shut Batopilas in on all sides, and fall off in a very steep declination, generally reach a hight of from 1500 to 2500 feet ahove the river flowing through the gorge, overtopped by the eliff-crowned peaks of the "Sierra Madre," and furrowed and divided hy deep ravines and rocky spurs; their surfaee heing eovered by a thiek vegetation of high thorny shruhs and gigantie eactus, whieh make it extremely unpleasant to leave the heaten traeks.

With regard to the

MINERAL VEINS,

Batopilas eompares favorahly with the richest mining districts; as at least one hundred, of more or less note, are known to exist iu a very limited eireuit—a majority of which seem to eoneentrate in one of the hills called the

"CERRO DE ANIMAS,"

to the north of the town, whieh really seems to he furrowed hy veins, as well as the hills "San Antonio" and "Descuhridora."

AS AUTHORITY,

to refer to, in regard to the richness of some of the mines of the district, there are only two sources left to us at present: say—a very limited numher of still existing official documents, and the traditious and experience of the old working men, whose number is, however, fast dying out.

The latter, if not entirely to he relied on, place in our discriminating hands a very serviceable thread, and are very often the only means of getting any information at all. The former prove to us, that in reality such vast amounts of silver were extracted that seem fabulous and incredible, yet leave no douht on this point.

Not all the various mines, however, gave their owners the riches of Crœsus: many turned out unremunerative; the number of those that gave great "honanzas" was comparatively limited. Again, we have here to consider, that the Spaniards of those days worked almost exclusively those lodes where they could see the silver cropping out on the very surface, leaving others, where such was not the case, unnoticed, or at least never went to any expense to prospect them. Principally among the former

"BONANZA MINES,"

rank "Pastrana," "Nevada," "Arhitrios," "Cata," "Dolores," "Vallinas," "Roncesvalles," "Carmen," "San Antonio," Descubridora," "Martinez," "San Pedro," and some others.

Besides these, there are a number more pointed out which are likewise known to have given their riches—some of them even at a recent day—to a greater or lesser degree, as for instance, "Camuchin," "San Antonio de los Tachos," "Candelaria," "Animas," "Baltazar," "San Nestor," "Trinidad," "Tajos," "Valencia," "Fierro," "Santo Domingo," "El Santo Nino," "Guadalupe," "Rosario." All these mines lay now more or less abandoned; their supporting pillars having been taken out for the sake of their rich metal, caused them to *cave in* entirely, or partly hlocking them up by ruhhish and rain, which for a great leugth of time entered freely through their unprotected openings.

As the reason of their ahandonment, it is not always to be supposed that it was their metal giving out. Auy such conclusion would be abnormal, and agaiust all practical experience and scientific obscrvations. The frequent discoveries of rich silver in them, within the last few years, show to the contrary, Their wealth most likely continues at some further depth beneath their present bottom. They have never been worked to any considerahle distance helow the surface; the greatest depth reported being that of the "Carmen" and "Pastrana," hoth of which are said to have obtained ahout 150 varas (440 feet English).

The Spaniards have a proverh in regard to this—"that all mines have three distinct and different periods of 'bonanzas';" meaning therehy that the giving out for a time of one need not discourage the miner, for, by going deeper, he will he sure to find the other.

And, in fact, the common reasoning, "that the old mines have been ahandoned on account of their heing worked out," is *entirely without foundation*; and only admissible where it actually has been proved; or to he concluded from exterior reasons. It is therefore much more likely, that new works, going below the old ones, *must strike again the precious metal somewhere.*

In some instances it may not he advisahle to work old miues anew; but this has always to he regulated hy local circumstances connected with the particular one.

Nature indeed seems to have favored the District of Batopilas with a most lavish and particular outfit of silver metal, in a virgin or almost pure state, which sometimes meets the eye with a color white as snow, yellow as gold, black as iron, or green as grass. Its ores are found in various comhinations, one of which forms the interesting *ruby silver ore*, whieh frequently presents itself in regular cut crystals of a hrilliant lustre and purple color. All the different classes turn out the most heautiful specimens, which serve to adorn cabinets, and are frequently purchased for more than their intrinsic value.

NATIVE SILVER

is generally classified as:

1st. MASSIVE.—"*Plata macira*," which may he hammered out or eut hy ehisels, but will not break.

2d. WIRE.—"*Plata Alambrada*," of more or less thiekness, which separate themselves by pounding; when very fine and near together it is called "*plata broza*," which yields one-half, and even two-thirds of the weight of the stone in silver.

3d. NAILS.—"*Plata de clavos*," silver in the shape of nails, more or less thiek.

4th. LEAVES.—"*Plata de hoja*," silver in the shape of leaves or sheets.

5th. LUMPS.—"*Bolas de plata*," showing little on the outside, rich inside.

6th. SULPHURETS.—"*Metal de Azogue*," showing small specks of silver, mostly sulphurets.

THE BENEFICIATING

of the foregoiug kinds of ores and metals is done, according to classes,

either by means of regular smelting works (*Hornos y Vasos de afinacion*), or by the application of quicksilver in the open "Patio" process (*Amalgamacion*), which latter is the most resorted to at present.

The yield ranges as follows:

First class metal will give from $2,000 to $4,000 per ton of 2,000 lbs, and as high as $32,000, which is the intrinsic value of pure silver.

Second " " from $800 to $2,000.
Third " Ore " $150 to $800.
Fourth " " " $60 to $100

per ton, varying according to care in assorting.

Although for a considerable portion of the ores a roasting process, before bringing them to the "Arrastra" (Mill), would be advisable, yet it has, however, not been followed out. Instead of which, the metalic residue or "tailings" (*polvillos*) is preserved until a sufficient quantity is collected to make it worth while to treat it in the smelting furnaces, where, by volatilization, a small part will be lost. These tailings, consisting of various pyrites (arsenical, antimonial, etc.) and sulphurets, will not amalgamate with the quicksilver in the "patio," but will also give from $400 to $800 to the ton.

THE MINERAL VEINS

of this District are characterized by all those attributes appertaining to such. They show distinctly their strike (*rumbo*), their dip (*hechado*) or inclination, and lay encased between the upper and lower selvages ("*respaldo alto y bajo*"). Their structure is very formal.

THE MATRIX

of the lodes seem to be of different natures. One class seems to have quartz or flint with copper pyrites; the other, "calspar." The latter ones appear to be by far the richest, and to have mainly produced those immense masses of native silver which made Batopilas so justly celebrated.

As a general rule, the metal in them does not commence before the depth of from 20 to 40 yards, when certain signs and well understood indications inform the persevering miner of the presence, either below or ahead, of a silver deposit. Principally among these

INDICATIONS ("PINTAS")

are the appearance of lead or iron pyrites, small crystals or specks of a yellowish blende (*copalillo*), and black or red sulphurets (*cardenillo*). Galena, as a general thing, is not found running on to any distance, but mostly on and near the surface, and of a poor *ley* (contents of silver).

The metal or ores are found to continue less, in large masses, in a longitudinal direction in the lode, but invariably increase when going perpendicularly. The veins may even run for a considerable distance, both ways, entirely barren, without even showing any of the usual armament, such as "calspar" or "borrasca;" yet the parts in ore are extremely rich, so that a single strike frequently turns out a large fortune. On the whole, the barren parts of the lodes seldom run more than forty varas in length; so that after cutting through this distance, the ore or metal is generally again found of more or less richness.

We know of two mines, "San Antonio" and "Pastrana," the first of which was worked at the begining of the present century, during *fourteen years*, and the latter during *eighteen*, both in a continual stream of silver, withofit interruption.

A very interesting, as well as favorable point, occurs in Batopilas, by the frequent occurence of smaller threads (*Hilos*), either crossing the main vein, or uniting themselves with it; containing, likewise, the precious metal, sometimes in really such astonishing quantities that it will pay well to work them; although they may commence with the thickness of a knife-blade, on a sudden they will widen out.

THE ROCK

of which the Batopilas mountains are composed, is principally "Diorite," extremely complicated with Granite or Syanite (compact feldspar with hornblend), with trausitions to dioritic porphyry, or *affanite*. It partly presents itself with a fine grain without hornblend, and at other times dividing into masses of different forms, like conglomerate, due probably to its elevation. Micarious porphyry forms sometimes the upper or lower wall of the granite, and unites, often, so intimately with it, that it is with extreme difficulty the respective ages of the rocks can be decided. Granite is chiefly found on the northern side of the "Animas" mountain, and as high up as the "Arbitrios" and "Roncesvalles" mines, of a gray or light reddish color, with a fine grain and little quartz and black mica, with some crystals and feldspar, or of a coarser grain with dark gray color, but neither sort being stratified.

This latter (stratified) rock is only found in a few localities, such as a part of the south side of the "Cerro de Animas," where the "Santa Teresa" mine lays; also in the "Cata" and "Pastrana" mines. On the north side of the same mountain, a small stretch on the spur, the "Baltazar" mine is found, and some other places on the San Antonio and Nevada Hills.

THE NUMBER OF MINES

which in former times were worked in the mineral district of Batopilas to a more or less degree, can certainly not fall short of a hundred; while those actually in operation will hardly come up to a dozen or two.

Those most favorably looked upon by the mining population, are at the present day, almost without exception, held by individuals as property by way and right of denouncement.

THE RIVER,

which flows through the valley, contains, all the year round, a good body of water, which moves the *Hacienda* of Mr. John Robinson, of sufficient capacity to do all the custom work for those mines at present developed and in operation; the water being enough to propel those *Haciendas* that may in future be erected.

THE CLIMATE

of Batopilas, during the winter months pleasant and warm, is, however, hot in the summer. Few cases of sickness are known—principally of the "Calentura" (fever); the poor ignorant people seldom have the means on hand to cure themselves, or are too indolent to use the remedies recommended to them.

THE HILLS

are mainly covered with a thick growth of thorny bushes, among which the "Torote," the "Mansto," the "Varaprieta," which might serve for medicinal purposes. Of higher growing trees there are but few, and these only in the valley along the river course; the "Guamachil," the "Mezquite," and once in a while a "Tepehuaje" in the humid parts of the ravines. Oaks, in various species, and pines, cover the more elevated parts and tops of the mountains, furnishing the timber required for building purposes and for ladders in the mines, while the most luxurious grasses everywhere cover the higher ridges.

THE COMMUNICATION

of Batopilas with the outer world is still very limited—due to its position in the mountains, and its insignificant traffic as yet not requiring any closer connection. Every month now of its reviving progress makes a regular and efficient one more and more imperious.

Whatever the present population requires for its consumption of the necessaries of life, is from time to time brought down from the mountains. The entire carrying trade is done on mule-back, and principally from and to the town of El Fuerte, distant about five days journey in the saddle, but of eighteen to twenty days for pack animals (*Atajos*). The freight paid to this place averages from $6 to $8 per carga of 300 pounds, or he it $39 to $52 per ton of 2,000 pounds.

The same, or a little more, is paid to and from the town of Alamos, in the State of Sonora, of six days distance.

Communication between Batopilas and San Francisco, California, may he had either via Mazatlan, Navachiste and El Fuerte, or via Guaymas, Santa Barbara and Alamos. The first route meets with the drawback that Mazatlan is not a safe port all the year, and the coasting trade at Navachiste is difficult for the reason of the strong N. W. winds prevailing, detaining the small crafts perhaps months in the accomplishment of their trips; whereas Guaymas, one of the best ports in the world, undisturbed in any kind of weather, affords the greatest safety in landing and shipping. The small coasters going south to Santa Barbara, accomplish their voyages in a day or two without accidents. The distance from the latter place to Alamos is about twenty-six leagues of a perfectly level wagon road. I may also mention, that in case of disturbances at Alamos, the route of Navachiste, from Guaymas, could he taken. The object of these lines is to inform the reader that there is no difficulty of communication, and that the Guaymas route is preferable to that of Mazatlan.

THE PRINCIPAL ARTICLES

of consume at Batopilas are either acquired from the villages of Chois, Baymena, or the small Indian towns and ranchos scattered in the valleys of the Sierra, and over the mountain sides, inhabited by the very numerous half civilized tribe of "Tarumaris."

The average prices at which such artieles of daily consumption are sold, by the quantity, are as follows:

Corn, per fanega	$6 00	to	$8 00
Beans, " " (frjiol)	8 00	to	10 00
Brown Sugar (panocha), per carga of 600 pieces	24 00	tu	28 00
Chile colorado, per almud			75
Beef, fresh, per pound			12½
do dried " "			25
Charcoal, per carga of 4 arrahas	1 00	to	1 25
Firewood, " "			37½
Salt, per fanega	7 00	to	8 00
Lard, per arraha of 25 pounds	6 00	to	9 00
Flour, per carga of 300 lbs	25 00	to	30 00
Tallow, per arraba of 25 lbs	5 00	to	7 00
Soap, per carga of 300 lbs	26 00	to	30 00
Tobacco, per arraha of 25 lbs	10 00	to	12 00
Oxhides, green, per piece	1 00	to	1 25
" tanned	5 00	to	7 00

The wood used for mining and building purposes sells likewise very high, as it has to he brought down during the rainy season from the mountain tops, with considerable trouble.

Mining Summary.

CALIFORNIA.

TRINITY COUNTY.—The Trinity *Journal* says the most cheering reports come from all sections of the county. Junction City is speaking loudest just at present. Parties who have lately visited Moore & Co.'s claim, just below Stordivant's, say that they are working dirt which throws the surface diggings of early days entirely in the shade, and that with the present water prospect they must take out a bushel of gold this year. We hope so. Field's new claim, opposite Junction City, is yielding regularly from $12 to $20 a day each for four workmen.

SHASTA.—According to the *Courier*, the amount of shipments from Shasta of bars of gold dust, through Wells, Fargo & Co., during the month of January last, sums up the fair aggregate of $79,070.92. January is a comparatively dull month for shipments. The present month nearly equals it now. These figures do not indicate any great falling-off in those mines.

During the year ending 31st December last, the Highland company at French Gulch took out $67,249.13, and the Washington company $20,112.59. Both claims promise increased yields the present year. This company handed in to Lewin & Co., on the 26th ult., the result of a ten-days' run. Amount after assay, $2,530.87, or $253 per day. This company is making dividends every month.

Horsetown is doing pretty well for a place where the placers are said to be exhausted. A few days since, Weil & Co., at that place, in one day purchased of the miners there ninety-six ounces. That was the amount for that day alone, not including the business in that line during the week.

The new mill on the Potosi lode will be in operation in the course of another week There are other lodes at or near Muletown that are being prospected, and it is believed, from the evidence already had, that the Potosi is not the only rich lode in that immediate vicinity.

The Honeycomb company has made no report, but from the best information we can get it is doing well.

The Washington company, after a thirteen days' run, cleaned up on the 26th ult. $2,819—a little over $217 per day. This mine is now thoroughly open, and there will be no delay for want of rock to feed the mill. On the last clean-up a dividend was made, and hereafter monthly dividends are expected. There are six thousand shares in the company, all owned by five persons. The last dividend amounted to 33⅓ cents per share. The coming monthly dividends will, of course, be larger, as the full force of the mill will run uninterruptedly.

The Bunker Hill placer claim continues to wear the belt. A recent run of two days yielded $306.25. Very good placer diggings, if only located in Idaho or Montana; yet the above is far below the general yield of this claim. Nine days' work, ending on the 6th instant, resulted in $1,119. The two subsequent days realized $837.

The *Independent* says an assay has been had from rock taken out of the Williams & Kellenger tunnel, and supposed to be near the lode for which they are driving, that assays $70 per ton.

TUOLUMNE.—The Sonora *Democrat* says that during the week we learned that gold-bearing quartz of great richness has been found in the neighborhood of Blanket Creek, some eight or ten miles from Sonora. Wm. Sutton, of Jamestown, is the lucky discoverer. Several others have located claims in the same district, and are getting out splendid rock.

From the Big Oak Flat section very encouraging reports are received in regard to quartz mining operations. The claims generally are turning out well on the other side of the river. About Deer Flat and the two Garrotes are several excellent paying mines. The mills and arastras now running are doing very well. This section is much richer in quartz than is generally known.

The Mount Vernon mine, on Friday, February 2d, cleaned up $6,000 as the product of eleven days' work.

NEVADA.—The *Transcript* says that the Union incline is now down about 170 feet below the surface, and the company is drifting upon their ledge in a northerly direction. The ledge is now about eighteen or twenty inches wide, and the rock is of excellent quality. The large Cornish pump worked by a twenty-five horse-power engine, is sufficient to keep the mine free of water. The Union ledge is among the best in this vicinity, and under the excellent system of working adopted by the superintendent, is bound to pay large dividends to the stockholders.

A fine lot of specimen rock was taken from the Mohawk ledge on the 16th instant. The lot was estimated to be worth about $1,500, and was contained in a small candle-box. A hundred tons or more of rock from the ledge is now being crushed at Palmer's mill. From the appearance of the amalgam in the batteries, the yield is likely to far exceed the anticipations of the owners. It is now thought it will come up to a hundred dollars a ton. Kidd & Tisdale are in luck.

Some fifty or sixty tons of rock lately taken from the Wigham ledge has been hauled to Stiles' mill, and is now being crushed.

The *Gazette* reports some fine looking quartz from the Pennsylvania mine, which by working process prospects at the rate of $130 per ton. That portion of the ledge from which this rock was taken is but eight inches in thickness, whereas the average width of the ledge is from eighteen inches to two feet—but what it lacks in quantity on that portion of the mine where they are now at work, is more than made up in the quality of the ore. The company has no trouble now with water, the mine being kept free with the pump running less than half the time.

The Grass Valley *National* has seen two gold bars, molten from gold of the Eureka mine, of which Wm. Watt is part owner and superintendent, each one valued at $8,800. The melting was done by Wm. Watt, and as a sample of turning the metal into bars, it is beautifully done.

The same paper speaks as follows of the placer mines in the upper portion of the county:

During the past year a large amount of money has been taken from the mines in the vicinity of Washington, says the *Transcript*. The cement claims of Woolsey & Co., and Knowlton, Maltman & Potter, have yielded some of the richest specimens ever taken out in the State. The two mills erected upon these claims at Brandy Flat have turned out excellent profits to their owners, and the proceeds will, in all probability, be greatly increased during the next year, as the mines will be thoroughly opened. At Rock Bar, a short distance above Washington, a number of companies are engaged in mining out an old channel of the Yuba river. The range of gravel which pays so well at Washington is supposed to extend from Fall Creek, thence through to Omega and Diamond Creek.

THE Grass Valley *National* of February 10th gives the annexed mining news: "Workmen have been engaged for three years past on the Stockton ledge, one mile west of the Globe Ranch, nine miles below Grass Valley. On Saturday a ledge six inches thick was found, from which two men took out over one thousand dollars in a few hours. Where the gold was found the ledge was within four inches of the surface of the ground."

REPORTED DISCOVERY OF A MAMMOTH QUARTZ LEDGE.—The Nevada (Cal.) *Transcript* says:

We recorded, a week or two ago, the finding of a quartz specimen by a man named Spayth, some ten or twelve miles above Nevada, which yielded $640 in gold. The specimen was found in a ravine just below a mammoth quartz ledge, from which it is supposed to have come. We have since learned some further particulars in regard to the ledge. It crosses Deer Creek at the Cascade Falls, about twelve miles above Nevada, and which is supposed to extend a hundred miles or more in nearly a north and south direction. It extends from Plumas through Sierra, Nevada, Placer and El Dorado counties, cropping out in places, but is generally barren. At Steep Hollow it is thirty or forty feet in width, and for some distance crops out to a hight of fifteen or twenty feet above the surrounding rock. We have frequently seen notices of this ledge in our exchanges, and we believe it is being worked successfully in some places in Plumas county. Locations were made on the ledge in this county as long ago as 1852, but the prospects not being favorable, the locations were abandoned. A number of locations have recently been made near where Spayth found the specimen, and we understand one company purpose running a tunnel to strike the ledge at a considerable depth. There is reason to believe that the ledge contains rich pockets, which, if found, would amply reward prospectors.

AMADOR.—We learn from the *Ledger* that on Friday of last week, twenty additional stamps were put in motion at the Oneida mill, two miles from Jackson, making forty in all. Since the purchase of this mine by the present proprietors, many useful improvements have been made, and they now have one of the best mills in the county. They are also sinking new shafts, which will materially facilitate the getting out of rock. The mill and mine are under the supervision of Mr. Pringle, and from the way he pushes forward the work, proves himself a most competent superintendent.

Wilson, Bailey & Co., in sluicing off their claim near Hornitos last week, on Monday came on to a quartz boulder, weighing three hundred pounds, and containing over one thousand dollars of gold.

TULARE.—Capt. A. B. Paul is pushing forward the work upon his mill in Kearsarge District, vigorously. The Kearsarge company's mill is on the ground, and will be put up as soon as the weather will admit. The unusual severity of the present winter has obstructed operations at Kearsarge to a very great extent. The higher portions of the district are covered with from five to ten feet of snow. The Kearsarge mine is the only one now being worked in the district The coming spring and summer will present quite a busy scene in this neighborhood. A saw-mill will be put in operation in the spring, to supply the wants of the district for lumber.

ALPINE.—The Mullan claim, as work progresses, is yielding large quantities of ruby silver. Several tons are to be hauled to the Pioneer mill for being worked.

G. W. Probasco, Esq., one of the original proprietors of the Flora claim, has recently arrived at Monitor, and commenced operations toward opening the claim. It is his intention to erect a mill as soon as the mine is sufficiently opened to warrant the enterprise.

The Buckeye, No. 1, has been placed in the hands of an Eastern company of capitalists for development. The work of development will be commenced forthwith, and pushed with energy.

The Scandinavian company, whose claim is located at the mouth of Scandinavian Cañon, and we believe the first claim located in Alpine county, are about commencing operations. The company got into financial difficulties some time since, and the incorporation was sold out by some of its creditors. Some fine quartz has been taken from the croppings, and the lode is esteemed highly by its locators.

Some very fine specimens of silver-bearing ore from the Balaclava claim, have been exhibited at Silver Mountain, at the office of Wells, Fargo & Co. The company have just commenced operations, and as the face of the mountain, where they have commenced their tunnel, stands nearly vertical, they will gain depth rapidly.

REESE RIVER.

The amount of bullion shipped from Austin, Reese River, during the month of January, was $49,171. It is said that Mr. Henry A. Gaston, formerly a lawyer at Austin, has sent to the office of the County Recorder a deed for mining property to the amount of $334,000. The sale was made at the East, where Mr. G. now is. He is expected to arrive at Austin shortly.

The *Reveille* is informed by a person just arrived from Yankee Blade, that the Confidence mine has just been pumped free of water, and the work of extracting ore has been resumed under encouraging prospects. The mill was to have commenced crushing last Monday.

A very favorable report has been made upon the character of the Lizzie Adams ledge, by J. W. Varney, superintendent of the Ware mill. The ledge has been traced for the entire length of the claim. An incline has been run of a few feet only in depth, but from which assays as high as $500 to the ton have been taken. It lies in a direct line with the Whitlach Union.

Claghorn District.—This new mining district is about fifty miles south of Austin, between the districts of North and South Twin River. It has been selected by W. D. Chilson, superintendent of the Spanish G. and S. M. company, as a suitable point for the erection of its mill. He claims to have there several superior mines, which he is at present working. The mill is a Gardiner crusher—the first of the pattern ever manufactured—and was warranted by the maker to crush fifty tons of rock daily; and Mr. Chilson estimates its practicable capacity—safely as he thinks—at twenty-five tons. One economical feature claimed for the crusher is, that it will require a motive power of only ten horses. It is said to pulverize the rock very thoroughly, and that the "pulp" will pass through a screen eighty to one hundred fine. Mr. Chilson frequently saw the Gardiner crusher in operation in New York, and he was altogether pleased with its work. In his opinion it will produce a revolution in the mill business, that will result in discarding the present battery of stamps. The mill is now at Egan Cañon, whence it will be brought in immediately to its destination, where it will be put in operation, it is hoped, by mid-summer.

VIRGINIA CITY AND VICINITY.

The mining prospects of this region are looking decidedly better than they have been at any previous time for the past twelve months. In all the mines of the Comstock ledge the prospects of richer developments exist. The Gould & Curry is once more alive. The Hale & Norcross is again jubilant, and the Yellow Jacket is beginning to find out that success consists in activity, labor and energy, more than in the speculations of Boards of Stock Brokers in San Francisco.

The Peavine district is also beginning to attract much attention. When the railroad is extended to that district of the State, it may count on rich freights of copper ore to be sent abroad for smelting.

The Overman are busy with their 600-foot level, and with good hopes of soon finding ore. The Empire and Imperial are moving quietly along, both preparing to sink for deeper levels.

The Gould & Curry made a new and important strike on the 13th instant, in their lower level, in the drift which is being run to connect the Bonner with the old Engine shaft. They are said to have a 5 foot vein, the entire width of which will average $50 per foot. This strike is about on a level with that lately made in the Hale & Norcross, and 170 feet north of the north line of the Savage. It appears to grow richer as the miners approach the line of the Savage; a fact of considerable interest and importance to that company.

The Ophir is still producing fine ore in the fourth and sixth levels, and operations, generally, at this mine are progressing most favorably.

The Chollar-Potosi company have lately struck a deposit of good ore in their mine, four hundred feet below the surface. The new strike is far east of the old works. Everything appears to be going east. We shall yet see all the hoisting works located beyond the eastern limits of the settled portions of the city.

Mines in Churchill County.—The *Appeal* has a letter from Churchill county. The Silver Wave Mill at La Plata is completed, and commenced work. It is a wet crushing mill of ten stamps, with capacity for ten more, and cost $100,000. It is said that there is no doubt but that there is plenty of ore to keep the mill running. There are eighteen men at work in the different shafts of the mines. The new town of Averill, a few miles north of La Plata, is improving. A mill is building there which is expected to be ready for crushing by the first of March. New York companies are investing some in Churchill county.

Just and True Economy

The Proprietors of the MINING AND SCIENTIFIC PRESS would call the especial attention of MINING SECRETARIES, TRUSTEE and SHAREHOLDES, to a few substantial reasons for the publication of Mining Notices in their journal—the first and only important newspaper of its class published upon this coast.

1st The PRESS enjoys a large and permanent subscription list, having a more universal circulation among shareholders and men intimately connected with mining interests than any other publication.

2d. Under the present law the publication of all mining notices on Saturday, in a weekly journal, complies as fully with the statutes as a daily publication. It is generally found to be equally as convenient for secretaries, and decidedly preferable to stockholders who have not time to examine throughout every issue of a daily.

3d. Economy in mining should always be looked upon with favor, and the cost for weekly advertising in the PRESS is less by ONE HALF than the rates of any other journal in this city possessing a respectable circulation.

4th. The publishers of the PRESS, making the mining interest their especial care, take particular pains to assist in the avoidance of errors in advertising. Our print is also more clear and perfect than can be expected in such papers as are hurriedly issued from cylinder presses.

5th. Our "Shareholders' Directory" forms a complete index of all mining notices published in San Francisco, by reference to which shareholders can at once see if their company is advertised, and determine whether the same is inserted in the PRESS or some other paper.

6th. Many copies of the PRESS are bound by prominent professional men, mechanics, secretaries, brokers, shareholders and others, as an important record for future reference, thereby rendering advertising, of every class, in its columns, of peculiar and permanent value.

7th. The benefit of having all mining notices consolidated in one newspaper, for the common convenience of shareholders, secretaries, and others who have occasion to refer to the same, is obvious. With this view we have established our rates at only fair, living prices, believing that a journal like ours, untrammeled by party, creed, or prejudice, is the only medium which can reasonably ask for such a consolidation of mining patronage.

8th. Advertisements in the columns of the PRESS, after their first insertion, are arranged alphabetically. Our present list is equalled only in one instance by that of any other journal. Shareholders, as well as strangers, naturally turn their attention to a mining journal for information concerns ing the mines and mining matters.

LAST, BUT NOT LEAST.—Our sheet (having been recently enlarged to the size of Harpers' Weekly) is now only equalled in its dimensions by one mining paper in existence—the *London Mining Journal*. Published in this, the greatest mining field of the world, we desire that the PRESS shall have no superior. We can only realize our cherished object of building up a reliable advocate of the science and business of mining, which will be of just honor and profit to our community, by experience and liberal patronage. The bestowal of such favors only as naturally belong to us, and which it is clearly for the benefit of the mining fraternity to extend, is all that is requisite, and we are confident we shall receive it

DEWEY & CO.,
Office Mining and Scientific Press.

4v11

ITS correspondents are men of science and learning, and hail from all parts of the coast. It is published at San Francisco, at $5 per annum, or $3 for six months. Address Dewey & Co., publishers of MINING PRESS, San Francisco. [Nye County News.

MONEY BY MAIL.—Subscribers and advertisers remitting us money in less sums than $50, can do so by mail at our risk, if they will register their letters; we will take no risk on unregistered letters, or letters by express. Remittances by express must be prepaid.

Mechanical.

THE RAZOR QUESTION.

Quite a discussion has been going on of late through the columns of the *Scientific American* with regard to the effect of heat in facilitating the cutting qualities of a razor. One considers that inasmuch as the microscope shows that the edge of a razor is notched, like a saw, the expansion of the steel by heat must have some unaccountable effect on those teeth; another accounts for the phenomena on the same principle that a hot knife cuts a cake of butter, or whittles a piece of horn easier than a cold one—that is, that the hot steel, in coming in contact with the beard softens it, and thereby allows the hot blade to cut it easier than the cold one. Various other theories have been proposed; but all quite unsatisfactory, and such as do not appear to answer the test of reason. The editor of the *Scientific American* finally comes to the conclusion that there is no difference in the cutting qualities of the hot and cold razor. He has tried the experiment carefully, shaving one side of his face with a cold blade, and the other with a hot one, and discredits the assumption altogether.

Now this razor question was thoroughly discussed and most philosophically settled nearly forty years ago in a number of the Franklin *Journal*, now before us, and published in Philadelphia in May, 1827. With respect to the editor aforesaid, who doubts the correctness of the opinion, that warmth facilitates the cutting of a razor, we think he can neither have a tender chin, nor a stiff beard; otherwise these doubts would have been fully removed with the removal of his beard.

Let any one shave with a cold razor and examine it carefully before wiping, and he will find a wall of wax-like matter along the edge, which limits its free action to a mere line, similar to the edge of a double-ironed plane; this wall of course prevents the free action of the razor. The same thing is observed by the mower, who is compelled to frequently wipe his scythe with a wisp of grass, and often to use a knife to remove the gummy substance which gathers upon the cold blade, near its edge, seriously interfering with its cutting qualities.

When a hot razor is used in shaving this wax-like wall will not accumulate — the matter forming it is removed as fast as it is deposited upon the hot steel. *The keeping of the edge of the razor clean*, is the cause of the difference in the cutting of the same blade, between its cold and hot condition. A cold blade cannot be kept clean by dipping it in cold water except with great trouble and frequent careful wipings. If it could, it would cut as well as a hot one. So much for the razor question.

EXPANSION DRILL.—Dr. P. Snell, says the Tuolumne *Courier*, has been for several days at work on a new kind of drill, the invention of a gentleman of Tuttletown, in this county, but whose name we have been unable to ascertain. It is intended to be used after the hole has been first bored with a common blasting drill, to enlarge the bottom and make a chamber. A steel rod flattened at the end, is the main shaft of the drill, on each side of this are cutters moving horizontally, these are thrown into each of the flattened sides of the main shaft. A pin with a rounded knob, similar in shape to a bell clapper, runs up a hole in the flattened end of the main shaft. This knob is slightly moveable. On striking the drill this knob is forced upwards expanding the cutters; and on removing the force, or cessation of the blows, the pin falls down to its original place, and the springs act as before described, so that the instrument can be easily taken out of the hole. By continuing this modus operandi, the chamber is created one, two, or three times larger than the original hole.

The principle of this drill appears to be almost identical with the "Linscott Chamber Drill" already fully described in this paper. The Linscott drill has no springs, gravity alone being relied upon to draw the horizontal cutters into the shaft of the drill.

STRIKE.—The workmen of the rolling mills and nail factories at Pittsburg, Wheeling and Maboney Valley, Virginia, struck for higher wages on the 3d of February. The mills are all stopped in consequence.

ON THE PREVENTION OF THE OXIDATION OF METALS.—Those familiar with the electrical science are well acquainted with the fact that zinc exercises positive relations with regard to most other metals. In other words, it possesses the power of keeping them in the negative state when in contact with them. In this negative state they are incapable of entering into combination with oxygen, and this circumstance may be applied with much advantage to the prevention of the oxidation of machinery, especially such parts of it as, in the case of marine engines, are liable to come in contact with water. Many instances will at once suggest themselves, in which such manual labor might be saved by the simple contrivance of appending a ring or a slip of zinc to the metal to be preserved bright. It would be especially applicable in the case of bayonets and rifle barrels; and a zinc edging to a scabbard would prevent rusting of the sword.—*Things not generally Known.*

A MODIFICATION OF THE LENOIR GAS ENGINE. A very valuable improvement in the Lenoir gas engine has been effected by M. Hugon, of Paris. Hitherto the explosion of the mixture of coal gas and air employed in these engines has been effected by means of a volatic spark, but M. Hugon effects it by a contrivance which is at once somewhat cheaper and much more regular in its working. To the slide or other valves regulating the admission of gas and air into the cylinder he attaches little burners, supplied with gas under pressure, and he so arranges that the flame from these burners shall explode the mixture in the cylinder at the proper time. These little jets are blown out by the explosion, but are afterwards relighted by an outer jet, which is kept constantly burning. This simple improvement seems likely to considerably diminish the uncertainty and irregularity which have hitherto characterized the action of the gas engine.

VALUABLE TIMBER.—The Nevada *Gazette* is informed by Thomas Hannah, that within a mile or two of Summit City there is a grove of yew trees, extending over a hundred acres or more of ground, the timber of which is said to be of an excellent quality for ship building. Some time since, some small specimens of the wood were sent to the master workman at the Mare Island Navy Yard, who stated that it was superior for ship building to any timber ever before found in California. Since then a board some eighteen or twenty inches wide and five feet in length has been sawed out of one of the trees, and sent to Mare Island, as a specimen of the size and character of the timber. The grove has been located, and is now owned by a joint stock company. Parties who have examined it carefully, say it is the only wood of the kind yet found in California.

NEW MOTIVE POWER.—At a recent session of the Paris Academy of Sciences, M. M. Burdin and Burgot laid before the members a description of the continuation of their experiments for obtaining the greatest amount of work from the hot-air machine, so constructed as to be adapted to a furnace resembling that of an ordinary steam engine. These gentlemen express a hope that the result of their thirty years' labor may be eventually the introduction of a new motive power superior to steam, and thus capable of increasing the wealth and power of civilized nations.

THE STRENGTH OF ICE.—The ordnance department of the Government has laid down the following rule, with regard to the strength of ice: Ice two inches thick will bear infantry; four inches, cavalry with light guns; six inches, heavy field guns; and eight inches, the heaviest siege guns, with 1,000 pounds weight to a square foot.

THE New York *Tribune* has ordered printing paper from Belgium, where it can be purchased for seven cents per pound in gold. It can be laid down in New York for less than fifteen cents, while the present price there is twenty cents.

MINERS' LEAGUE.—A miners' league has been formed in Union district, Reese River, having for its object (so reported) the prevention of the employment of Cornish miners to the seclusion of others.

HIGH RATES.—In Minnesota a carpenter gets at the rate of three bushels of wheat or fifteen bushels of potatoes for a day's work, and a laboring man gets a per diem that will purchase two bushels of wheat or ten bushels of potatoes.

GEOLOGY is Time's own biography, printed, paged, collated, and bound by the fingers of Omnipotence.

MINING AND SCIENTIFIC PRESS

PATENT AGENCY.

For the Pacific Coast.

OFFICE OF THE MINING AND SCIENTIFIC PRESS—No. 505 Clay street, corner of Sansome, San Francisco.

Information for Inventors!

Inventors on this coast can have their applications for patents made out through our Agency and sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington.

The first question that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. Englishi, French, Austrian, Prussian, Spanish and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against citizens of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $30. If the patent is granted no further agency expenses ensues. If the application is rejected we cause thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, our Washington agent has access to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequaled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: Dewey & Co., Mining and Scientific Press, No. 505 Clay Street, corner of Sansome, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first instalment of the Government fee, fifteen dollars. The money may be sent by express or otherwise with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered in our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his execution, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, send us the ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance.

The following is the Government tariff of fees established by law:

On every application for a design, for 3 yrs and 6 mos...	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years.....	30
On every application for a patent, for seventeen years...	15
On every caveat.....	10
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	20
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C....	25

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

N. B.—We make out our own forms for applications, etc., and would respectfully inform all parties that we have no printed blank forms for sale.

Commencement of Twelfth Volume

—OF THE—

Mining and Scientific Press

Published Every Saturday.

The title of our journal is a truthful expression of its character.

It affords a class of progressive information to the Miners, Mechanics and Professional Men of the Pacific Coast, which cannot be derived from books, or other publications.

Each Volume comprises, in reality, a book of new intelligence and facts relating to Mining, Mechanism, Metallurgy, Science and Art, developed by our rich and peculiar resources, and identical with our own industry and history.

By the encouragement of intelligent economy in LABOR and GOLD-SAVING, we shall make the PRESS a source of INDIVIDUAL PROFIT to its patrons, as well as a public benefit to every local community in which it circulates.

The prospects of our journal are now brighter than at any former period. Our facilities for furnishing a valuable paper are constantly increasing.

Following are some of the many opinions generously expressed by our neighbors:

Editorial Expressions:

The publishers intend to make it the "Scientific American" of the Pacific Coast. Every miner should have a copy of it in his cabin, for it will be filled with useful information to the pick and shovel fraternity.—[Trinity Journal.

Should be taken by every man owning "feet" [and brains] in this State.—[Deacon.

In no other ten journals can the reader find the same amount of reliable mining news as in the PRESS.—[Contra Costa Gazette.

Every stockholder in different mines will find it will pay to take and read this mining journal.—[Contra Costa Gazette.

The PRESS is to the Pacific Coast what the "Scientific American" is on the Atlantic. It deserves its success.—[Aurora Daily Times.

It is fully up to the times, and furnishes the latest mining improvements and intelligence.—[Calaveras Chronicle.

Every miner should subscribe for the PRESS.—[Calaveras Chronicle.

It presents a channel through which all mining notices may be cheaply consolidated into one sheet for the convenience of all stockholders.—[Mountain Messenger.

We can give our testimony that it is always replete with useful and valuable information to miners and mechanics. [Placer Herald.

It contains correspondence from different sections, giving accounts of new discoveries in gold, silver and copper, and should be taken by every person that wishes to keep well posted on the developments of our State and the Territories.—[Mountain Messenger.

With the last number is an index to the whole volume, most useful and valuable to those who keep files of that paper.—[Shasta Courier.

Prof. J. D. Whitney's address on Mining, is given entire. * * * We preserve the PRESS, and would like to have a full file.—[Napa Reporter.

The public should support the enterprise of the MINING PRESS, one of the best papers in the State, by a liberal patronage, as it is only by a system of legitimate reports that our mines can be favorably brought before men of capital below.—[Calaveras Chronicle.

Under the management of Messrs. Dewey & Co., the PRESS has been much improved in every respect. * * It deserves a liberal support.—[Virginia Union.

A good paper for this country.—[Humboldt Register, Ne.

Those who would have a good paper of this character, should subscribe now.—[Marysville Appeal.

It embraces one of the finest fields in the world, and seems to improve it. * * * It will be second to no scientific record now published on this continent.—[Los Angeles News.

A neat and useful journal. One of the most presentable and useful to the State.—[Sunday Mercury.

Such a journal has been needed on the Pacific Coast. The PRESS fills the bill.—[Reese River Reveille.

A splendid paper, and should have a good list of subscribers in prosperous Grass Valley.—[G. V. National.

We receive, regularly as clock work, this exceedingly valuable and interesting journal.—[Napa Reporter.

Interesting and important to miners and Mountain men. [Butte Record.

Friends pleased with our efforts in the publication of the PRESS can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

SUBSCRIPTION IN ADVANCE.

One Year, (two volumes).....	$5.00
Six Months, (one volume).....	3.00

☞ BOUND VOLUMES FOR SALE.☜

FOR ADVERTISING

Our terms are very reasonable. MINING COMPANIES are especially favored by our rates, and careful attention is given to the legal publication of MINING NOTICES.

DEWEY & CO., Publishers.

OFFICE—No. 505 Clay street, corner of Sansome, 2d floor.

Terms of Subscription:

One copy, per annum, in advance,.....$5 00
One copy, six months, in advance,.....3 00
☞ For sale by Carriers and Newsdealers.☜

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reador must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons bolding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

Mr. Wm. R. Brndshaw, is our Special Correspondent and Traveling Agent. All favors or assistance rendered him in his progress through the country in behalf of our journal, will be duly acknowledged.

SAN FRANCISCO, Jan 1st, 1866.

Mr. A. C. Knox, is our fully authorized Traveling Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.

SAN FRANCISCO, Jan 11th, 1866.

Mr. I. N. Hudson, is authorized to solicit subscriptions, advertising, etc., for the MINING AND SCIENTIFIC PRESS, in San Francisco, and to receipt for the same.

San Francisco:

Saturday Morning, Feb. 24, 1866.

Endorsement by the Miners' State Convention.

The following resolution was adopted by the California Miners' State Convention, held at Sacramento, Jan. 17th, 1866:

Resolved, That we regard a mining paper or journal of great importance to the mining interest of California, and we recommend the MINING AND SCIENTIFIC PRESS, of San Francisco, to the consideration and support of the miners of the Pacific coast.

THE UNION COPPER MINE—RICH DEVELOPMENTS.

We are permitted to make the following extract from a private letter received in this city a few days since, from a gentleman who has just visited the Union mine, in Copperopolis:

The prospects of the permanency of this mine were never so great as at the present time. I was down in the mine last Friday, when I saw, in the 500-foot level connected with the middle shaft, a vein of concentrated No. 1 ore, twenty-five feet in width, so far as explored (its full width not yet being known). In following that deposit eighty feet upward, to the level above, the width is there found to be twenty-eight feet. This will give you some idea of the future of the Union mine. In the No. 3 shaft they have also found a vein of concentrated ore, at a depth of 400 feet, that keeps widening, as they drift upon it to the southward. It is my honest opinion that they have only commenced finding the real depth of the deposit in the Union mine.

In order to arrive at some definite idea of the actual value of the immense deposit above spoken of, in the middle shaft, let the reader calculate the cubic contents of the mass, which is now known to be of the following dimensions:—Hight, 80 feet; width, 26½ feet; length, 150 feet. This will give us 3,180,000 feet; nine feet to the ton, and $60—the known value of the ore per ton—gives us a cash value of over two *millions of dollars* from this single mass, above the present lower level! According to all human calculations, the half of it is not yet developed. And yet this is only the first class ore which will be taken from the middle shaft only! When we take into account the immense amount of reserved ore in that and the other shafts, and the further developments yet to be made—this must be confessed to be the most remarkable mine in the whole history of copper mining.

RETURNED.—John C. Fall, Esq., a gentleman pretty well known throughout this State and Nevada, has recently returned to Humboldt well equipped for effective work for the development of several mines in that vicinity. The *Register* says that parties East have purchased his mill, and in connection with it several mining claims conveniently situated for working; and have provided him the means to prosecute vigorously the work of opening the said claims, and bringing the bullion to the surface. We wish him and his co-workers the fullest success in their undertakings.

A NEW BILL CONCERNING CORPORATION ASSESSMENTS.

In the State Senate, on Wednesday of last week, the Hon. Henry Robinson, of Alameda, introduced the following Bill, which was referred to the Committee on Corporations and ordered printed:

AN ACT CONCERNING ASSESSMENTS UPON THE STOCK OF CORPORATIONS.

The People of the State of California, represented in Senate and Assembly, do enact as follows:

SECTION 1. The Trustees of any corporation, formed under the general laws of this State, shall have power to levy and collect, for the purpose of paying the proper and legal expenses of such corporation, assessments upon the capital stock thereof, in the manner and form, and to the extent hereinafter provided, and not otherwise.

SEC. 2. No one assessment shall exceed five per cent. of the stated amount of the capital stock of the corporation, named in the articles of incorporation, and none shall be levied while any portion of any previous assessment shall remain unpaid, or uncollected, except in cases where all the powers of the corporation shall have been exercised in accordance with the terms of this act, for the purpose of collecting such previous assessment, and except, also, the collection of a previous assessment against one or more stockholders, restrained by injunction or otherwise; in which case, further assessment may be levied and collected according to this act.

SEC. 3. No assessment shall be levied except by order of the Board of Trustees, concurred in by a majority of said Board, and entered upon the records of the corporation.

SEC. 4. Every order levying an assessment shall specify the amount thereof and the time when the person or persons to whom and the place or places where the same is payable. It shall also appoint a day subsequent to the full term of publication of the assessment notice on which the stock upon which assessments remain unpaid shall be deemed delinquent, which said day shall not be less than thirty, nor more than sixty days, from the time of the making of the said order levying the assessment, and a day for the sale of delinquent stock, which shall not be less than fifteen, nor more than sixty days from the time appointed for declaring said stock delinquent.

SEC. 5. Upon the making of such an order, the Secretary shall cause to be published immediately a notice thereof in the following form:

"[Name in full.] [Location of works.] Notice is hereby given that at a meeting of the Trustees of said Company, held on the [date], an assessment of [amount] per share was levied upon the capital stock of said Company, payable [when, to whom, and where, particularly]. Any stock upon which said assessment shall remain unpaid on the [day fixed] shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on the [day appointed], to pay the delinquent assessment, together with costs of advertising and expenses of the sale. [Signature of the Secretary, with particular location of office.]"

SEC. 6. Said notice shall be published once each week for four successive weeks in some daily or weekly paper published at the place designated in the articles of corporation as the principal place of business of the corporation, and also in some paper published in the county in which the works of the corporation are situated, if a paper be published therein: *provided*, that if the works of the corporation are not situated within some State or Territory of the United States, then publication in a paper of the County shall not be necessary; *provided, also*, that if there is no newspaper published at the place designated as the principal place of business of the corporation, then the publication shall be made in the newspaper published nearest thereto; and *provided, also*, that the notice specified in the 5th section of this act may be served by delivering a copy thereof, certified by the Secretary, to each stockholder personally, and in case of such service upon all the stockholders of said corporation, then no notice by publication shall be necessary, and such personal notice shall be deemed complete.

SEC. 7. If any portion of the assessment mentioned in said notice shall remain unpaid on the day specified therein for declaring the stock delinquent, the secretary shall, unless otherwise ordered by the Board of Trustees, cause to be published in the same papers in which the notice provided for in Sec. 5 shall have been published, a notice substantially in the following form:

"[Name in full. Location of works.] *Notice.*—There is delinquent upon the following described stock, on account of assessment levied on the [date,] [and assessments levied previous thereto, if any,] the several amounts set opposite the names of the respective shareholders, as follows: [Names, number of certificate, number of shares, amount.] And in accordance with law, [and an order of the Board of Trustees, made on the [date,] if any such order shall have been made,] so many shares of each parcel of said stock as may be necessary, will be sold at the [particular place,] on the [date] at [the hour] of said day, to pay said delinquent assessments thereon, together with costs of advertising and expenses of the sale. [Name of Secretary, with particular location of office.]

SEC. 8. Said last named notice shall state every certificate of stock with the number of shares which it represents, and the amount due thereon, separately, except where certificates may not have been issued to parties entitled thereto, in which case the number of shares and amount due thereon, together with the fact that the certificates for such shares have not been issued shall be stated.

SEC. 9. Said notice, when published in a daily or weekly paper, or in both, shall be published as follows: When published in a daily paper, the same shall be published for a period of ten days, excluding Sundays and holidays, previous to the day of sale. When published in a weekly paper, the same shall be published for two weeks previous to the day of sale. The first publication of all delinquent sales shall be at least fifteen days prior to the day of sale.

SEC. 10. By the publication of the said notices, as hereinbefore provided, the corporation shall acquire jurisdiction to sell and convey a full, complete, perfect, and absolute title to all of the stock described in the notice of sale upon which any portion of the assessment or costs of advertising shall remain unpaid at the hour appointed for the sale, but shall sell no more of such stock than is necessary to pay the assessments due and cost of sale.

SEC. 11. On the day and at the place, and as nearly as may be at the hour appointed in the notice of sale, the Secretary, who is hereby fully empowered and authorized, shall, unless otherwise ordered by the Board of Trustees, sell, or cause to be sold at public auction, to the highest bidder for cash, so many shares of each parcel of said described stock as may be necessary to pay the assessment and charges thereon, according to the terms of said notice of sale; *provided*, that if payment be made before the time fixed for sale, the party paying shall only be required to pay the actual cost of advertising.

SEC. 12. The person offering at such sale to pay the assessment and costs for the smallest number of shares, or fraction of a share, shall be deemed the highest bidder.

SEC. 13. If, at the sale of any stock under the foregoing provisions of this Act, no bidder shall offer to take and purchase the same for the amount of the assessments, and costs and charges then due upon the same, then and in such case the same may be purchased and bid in by the company or corporation, through the Secretary or President, or any Director or Trustee thereof, at a sum equal to the amount of the assessments, costs, and charges due upon the same; and in pursuance and by virtue of such purchase, the said assessments, costs and charges, shall be credited, as satisfied and paid in full, on the books of such corporation, and entry of the transfer of such stock to such corporation, in pursuance of such sale and purchase, shall be made on the books of said corporation. While such stock shall remain the property of such corporation, the same shall not be assessable, nor shall any dividends be declared upon the same; but all assessments and dividends shall be apportioned upon and against the other stock of such company not owned by such corporation. All purchases of its own stock made by any corporation, in accordance with the provisions of this section, shall be held valid, and as vesting the legal title to the same in said corporation, and the stock shall be held subject to the control of the remaining stockholders, who may make such disposition of the same as they may deem fit, in accordance with the by-laws of the corporation, or vote of a majority of the remaining shares. Whenever any portion of the capital stock of any corporation is held by the said corporation by purchase, a majority of the remaining shares of stock in said corporation shall be held to be a majority of the shares of the stock in said incorporated company, for all purposes of election, or voting on any question before a stockholders' meeting.

SEC. 14. The time fixed in any notice of assessments, or notice of delinquent sale, published according to the provisions of this Act, may be once extended for a period of not more than thirty days, by order of the Board of Trustees, duly made and entered on the records of the corporation; but no order extending the time for the performance of any act specified in any notice shall be effectual, unless notice of such extension or postponement be appended to and published with the notice to which the order relates.

SEC. 15. No assessment duly levied shall be rendered invalid by a failure to make proper publication of the notices hereinbefore provided for, nor by the non-performance of any act required to be performed in order to enforce the payment of the same; but in case of any substantial error or omission in the course of proceedings for collection, all previous proceedings, except the levying of the assessment, shall be void and publication shall be begun anew.

SEC. 16. No suit shall be maintained to recover stock sold for delinquent assessments or to invalidate any such sale on the ground of irregularity or in making the assessment, or defects or irregularity in the sale or notice of it, "unless the party seeking to maintain such action shall first pay or tender *to the corporation or party holding such stock so sold*, the sum for which the same was sold, together with all subsequent assessments which may have been paid thereon, and interest from the time they were paid; and no such action shall be sustained unless the same shall be commenced by the filing of a complaint and the issuance of a summons thereon within six months after such sale shall have been made.

SEC. 17. "An Act Concerning Assessments upon Stock of Corporations," approved April 4th, 1864, and all Acts and parts of Acts, inconsistent with the provisions of this Act, are hereby repealed; *provided*, that such repeal shall not affect proceedings commenced for the collection of assessments heretofore levied, but all such assessments may be collected in accordance with the provisions of the laws then in force.

SEC. 18. This Act shall take effect immediately.

EASTERN CAPITAL FOR THE MINES.—We understand that dispatches have been received stating that General Rosecrans is now on his way back to this city, with capital for developing certain mines in which he is interested, in Lower California and elsewhere. The General will also take an active part in the initiatory preparations for starting the work at the western terminus of the Southern Pacific Railroad. It is understood that a large number of prominent capitalists are engaged in this enterprise, and that all the aid required for its construction can be easily obtained. The General, in both these enterprises, represents numerous heavy capitalists and prominent individuals at the East.

We would also state, in this connection, that Capt. Winder, formerly in command at Black Point, near this city, and who arrived here per steamer two weeks since, has gone down the coast to take charge of a mine located at a point in Lower California, about forty miles south of the California State line, and some eight miles from the seacoast. The Captain, during his visit to the East, negotiated a sale of these mines, in which both himself and Gen. Rosecrans are interested, to a Philadelphia company, composed of some of the heaviest capitalists in western Pennsylvania. Capt. Winder goes down to superintend the work at the mines for this company. We are pleased to learn that during his absence at the East, some very rich and important developments were made at the mines, which have greatly increased their value and importance.

CORRESPONDENCE.—We have received, in addition to correspondence already noticed, and not published, the following communications:—"Electricity the Cause of Earthquakes;" "The Mammoth Mining District" of Nye Co., Nevada; A Letter from Aurora by "* * * * *;" A Letter from our Regular Correspondent, dated Amador, Feb. 1; "Blue Lead," from Nevada City, and another letter from "M," of Brown's Valley.

QUEEN EMMA, of the Sandwich Islands, now on a visit to England is said to be suffering in bodily health from the severe tax imposed upon her by the English public in almost compelling her to travel from place to place to satisfy the natural curiosity to see her. Her medical advisers have been compelled to positively forbid her any further appearance in public until she has had time to recuperate.

CHEAP TELEGRAPH.—Since the opposition telegraph line between San Francisco and Virginia has gone into operation, telegraphic rates have been reduced to fifty cents for ten words.

POSTPONEMENTS.—We would again call the attention of Secretaries to a certain point of the mining law, too commonly overlooked, viz: The requirement that all postponements must be added previous to the expiration of the regular publication of assessment or sale notices.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

MINING SHAREHOLDERS' DIRECTORY.

List of Notices of Meetings, Dividends, Assessments and Delinquent Sales.

Comprising the Names of Companies, District or County of Location, Amount of Assessment, Date of Meeting, Delinquent Advertisement and Sale, and Amount and Time of Payment of Dividends.

Monthly Series (or parts), containing 4 Nos	50
Monthly Series, containing 5 Nos	62½

THE CIRCULATION of the PRESS, already extensive, is rapidly increasing, and substantial men who can profit by widely disseminating information of their business amongst the most intelligent, influential and industrial classes of the Pacific States and Territories will find no more effectual or economical medium for advertising

DEWEY & CO., Proprietors.

Patent Agency and Job Printing Office, 505 Clay street, San Francisco. July 1 1865

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three month's delay requisite in transacting business through Eastern agencies.

Our Circulation.—THE MINING AND SCIENTIFIC PRESS has a large and permanent subscription list, and enjoys a more universal circulation among stockholders and persons directly interested in mining than any other paper on this coast.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, February 24th, 1866.

Semi-Annual Reports of the Savings and Loan Institutions of San Francisco.

NAME.	Date of Rpt	Deposits.	Loans.	Earnings.	Reserve Fund.	Cash on Hand.
Hibernia Savings & Loan Society	Jan. 21, 1866	$3,211,943 55	$3,075,716 97	$179,511 99	$81,3 2 60	$327,281 73
Savings and Loan Society	Jan. 1, 1866	1,596,869 73	1,320,231 59	84,3 2 22	41,876 34	224,484 10
San Francisco Savings Union	Dec. 31, 1865	620,093 35	699,374 27	42,235 50	52,706 69	70,002 28
French Savings & Loan Society	Jan. 15, 1866	1,361,155 27	1,428,381 10			
Cal. Building and Loan Society	Nov. 1865	212,000 00	120,000 00		58,000 0	
Totals		$7,003,061 6	$4,751,2?6 85	$306,000 80	$236,9 5 63	$621,768 10

During the recent agitation of the currency question by the Legislature of this State, with a view to a repeal of the Specific Contract Law, a large number of deposits were withdrawn from several of the above institutions, particularly from the Hibernia; but since the final vote in the Senate against the proposed change, confidence has been restored, and the reflux is even greater than before. As is well known, the loans made by these associations are secured by mortgages upon first-class real estate, and repayable in monthly installments. The Hibernia Savings and Loan Society declared, during the past six months, dividends of one ℔ cent. per month; the S. F. Savings Union declared 1 1-5 ℔ cent. per month to term depositors, and 1 ℔ cent. to ordinary. The California Building divided 1½ ℔ cent. per month. Pending the action of the Legislature, it was deemed prudent to carry unusually heavy cash balances, which, of course, decreased the percentage depositors derived from the gross gains; but this is no longer necessary, and loans are now made with more freedom.

The Money Market presents no new feature. A fair degree of activity prevails, and the current rate in bank is 1@1¼ ℔ cent. per month, with occasional transactions upon more favorable terms to the borrower.

Receipts of treasure from domestic sources, since our last reference, have amounted to nine hundred thousand dollars, making an aggregate of some three million dollars thus far during the current month. Bullion has been in good demand for shipping purposes, and sales of gold bars were made at about 850; silver bars range from ¾ to 1 ℔ cent. premium.

Legal Tender Notes are dealt in at the Board to the extent of $60,000 at 73¼@73⅜c., closing at 73¼c. bid. Our latest telegraphic advices from the East quote gold at 137.

The Mining Share Market has been somewhat irregular this week. Some stocks met with a material decline, while others have been well maintained at a slight advance. The tenor of advices from a number of claims is considered favorable.

Gould & Curry receded from $1,050 to $1,000, then sold at $1,030, buyer 30, and closed at $1,050 asked. The body of ore found recently on the "2d station" is said to be improving. The company's mill is now running up to its full capacity, and during the first 16 days of this month, 1,925 tons of ore were reduced at that establishment.

Savage has been actively dealt in, and some 200 feet changed hands, steadily declining from $1,025 to $770, seller 30, and selling yesterday at $800@$840. The drift from the bottom of the prospecting winze on the lower level now discloses a less formidable body of ore than was supposed to exist at that point. Mr. Chas. Bonner has been chosen superintendent in lieu of Mr. Curtis.

Hale & Norcross declined from $980 to $940, advanced to $990, dropped to $960, rallied to $1,010, and sold at the close at $1,050 bid, b. 30. The newly-discovered ore deposit in the 700-feet level is said to look promising, and has been tolerably well developed a distance of nearly 100 feet north and south. The ore strata, with the quartz lying to the west of it, also presents a flattering appearance, and is thought to indicate the existence of an extensive body of ore in the next level below.

Crown Point rose from $900 to $975, and closed yesterday at $1,025 bid. During the week ending February 16th, 590 tons of ore were extracted from this mine. In breasting out the full width of the lode going north, the ore deposit is 30 feet wide in the 300-feet level. The incline 60 feet from the north line is now down some 20 feet in fine ore, a small portion of which is being reserved for dry crushing. Shipments of bullion during the current month have amounted to about $80,000 thus far.

Yellow Jacket has been dealt in to the extent of 325 feet, advancing from $440 to $480, dropping to $440, rallying to $470, then declining to $360, seller 30, and selling yesterday at $390@400. During the week ending February 12th, 647 tons of ore were hoisted to the surface; 120 tons were reduced at outside mills, yielding $33.77 per ton, and the total receipts of bullion amounted to $14,850. The Kentuck company, in drifting to the Yellow Jacket line, and then west, at a depth of 285 feet, have met with a body of fine ore, supposed to be a continuation of the West stratum on the Crown Point.

Ophir has been rather steadily maintained, advancing from $435 to $450, receding to $430, and closing at $425. This mine continues to produce some fine ores taken from the fourth and sixth station levels. In the ninth gallery there is nothing new. The south drift has now reached a point 90 feet north of the Central shaft.

Chollar-Potosi rose from $305 to $325; receded to $306, and then sold at $306@324. Within this range more than 300 feet was dealt in. The Grass Valley Station is said to have improved a little recently. The Bajazette ground shows no change, and the Stope over head of Incline is looking as well as formerly. In the 2d Station the south end shows some improvement in raising up. Station 60 feet below Potosi tunnel good ore is now found on both sides of the old works. In the mine, new shaft, etc., 154 men are now employed. During the week ending February 16th, 637 tons of ore were sent to custom-mills, yielding an average of about $28 per ton, and 591 tons were sold at an average of $5½ per ton.

Alpha rose from $260 to 280, then sold at $240@242, closing at $245. Belcher rose from $190 to $220, buyer 30, dropped to $170, rallied to $185 and $190, buyer $30, and sold yesterday at $190@195. Empire Mill and Mining company met with small sales at 175@180, closing at $190 asked.

Imperial advanced from $116 to $121, and sold yesterday at $119 @$120, seller 30. The yield of the Company's mill for the first two weeks of this month amounted to $29,632.

Bullion rose to $67, fell to $59, and sold yesterday at $58@$59. Drifting still continues at a depth of 680 feet, and it is thought that the lode will be reached east of the engine shaft.

Overman has been sold at 48 to 55, and closes at $55. Work is progressing vigorously in the 600-feet level west and north of the engine shaft.

Confidence suddenly advanced from $41 to $63, then declined to 50 and closed at $75. Lady Bryan was sold at 4@4½, Exchequer 6¼ @7, Wide West at $9, and Sierra Nevada at $8.

The aggregate recorded sales of Stocks and Legal Tender Notes, since Saturday last, amounted to $839,191 50.

ELECTROTYPE CUTS, ENGRAVINGS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State.

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alterations which they may desire made in their advertisements at their earliest convenience. New advertisements should be sent in as early as possible.

TWELFTH VOLUME.—The MINING AND SCIENTIFIC PRESS, published at San Francisco, commenced its twelfth volume on the 6th inst.—[Nye County News.

After the War the Mines.—This was the policy of President Lincoln, and in keeping with this we find our generals making reports from the metalliferous districts, and disbanded soldiers, Federal and Confederate, delving for the metals, In the old gold districts of Virginia the scene of the battles between Lee and his Federal opponents, there is a return to the gold searchings of other days. More than two million dollars of gold were obtained in the past from Culpepper, Louisa, Goochland, Orange, Spottsylvania, Fluvanna, Buckingham, Prince Edward, and other and neighboring counties of Virginia, and since the Rebellion closed hundreds of former Confederate soldiers having engaged in washing the gold deposits. It is stated that about two thousand of such miners are now at work in Lonisa and Goochland counties, and that the average is two pennyweights a day to each miner. Some of the quartz is crushed with stone and iron mortars.

Situation Wanted.

An Engineer, who would take charge of a Stationary Engine, in the city or country, for a reasonable salary, desires a situation. Address, "Engine," Box 17, San Francisco Post Office. 5v12tf

Trades and Manufactures.

Our Patent Agency.

The Patent Agency of the Mining and Scientific Press has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of Letters Patent from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

To Mining Companies.

A GENTLEMAN OF MUCH EXPERIENCE AS A MINing Superintendent, in England, Spain, and on the Pacific coast, and one intimately acquainted with every department of mining, and with nearly every class of mineral, is desirous of securing a position as Superintendent of some mining operation in California or Nevada. The applicant was for four years Superintendent of the New Almaden Quicksilver Mine, in this State. The best of references given on application at this office.
San Francisco, Oct. 12, 1865 5v11tf

REMOVAL.
MONS. A. COULON,
Informs his patrons that he has removed his DRAWING SCHOOL from Pine street to
410 Kearny Street.
Drawing Classes in the Evening will take place as usual. DRAWINGS FOR PATENTS accurately and neatly done.
20v11-1m

Volume Twelfth.—The Mining and Scientific Press, with its last issue, commenced its twelfth volume. Since Dewey & Co. have "held the ribbons" its gait has been rapid toward a perfect journal. Its appearance evidences its prosperity, but doubtless, like some of the rest of us, it can stand increased encouragement. Let such be given, and, our word for it, volume thirteen will acknowledge receipt.—[Golden Era.

Metallurgy.

MOSHEIMER'S CONCENTRATOR
RECEIVED THE FIRST PREMIUM

From the ROYAL POLYTECHNIC SOCIETY, in Cornwall, and was highly recommended by the Commissioners as the most Simple and Effective Concentrator for all kinds of Ores.

Every Quartz Mill ought to have them, as they not only save Gold and Silver, but also the Quicksilver and Sulphurets, without extra labor. They can be built entirely of wood at the mine, and will separate more perfectly in one operation, than any other Concentrator in use. Apply to

J. MOSHEIMER,
23v11qy 423 Washington street.

EUROPEAN
METALLURGICAL WORKS,
—and—
Practical Mining School,
Bryant Street, Between Third and Fourth,
SAN FRANCISCO.

The Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

A Business Compliment.

Petaluma, Oct. 4, 1865.

Messrs. Dewey & Co.—Gentlemen: Your note informing me that my patent for Crushing and Baling Machine is ordered to issue is at hand. Please accept my thanks for the prompt and business like manner with which the case has been conducted, and inclosed find twenty dollars for balance Government fees. Respectfully, etc.
JACOB PRICE.

A Hard Luck.—The Placerville *Mirror* gives the State Fair the following sidewinder:

As what is facetiously called the State Agricultural Society is again before the Legislature, it would be well for the members to see to it that the premium list is in future made up differently. A horse-race (which would have been run anyhow, and is of no benefit to the public,) was awarded $3,000, we believe, while the exhibitor of *thirty-five* varieties of foreign grapes from this county received $15.

OUR NEW YORK AGENCY.

Oakland Water-Cure.

APRIL 1ST, 1864, WE OPENED A HYGIENIC BOARDING House and Ladies' Health Institute in Oakland. The great advantage we have experienced since that time, in the treatment and cure of all those diseases peculiar to females, as well as those common to all, over that of San Francisco, induced us to give up the treatment of gentlemen in the city. We have accordingly removed our entire Bathing, Electro-magnetic, and Gymnastic Apparatus, which we used especially in the treatment of males, to our Health Institute across the Bay, and have found, after a trial of seven months, that gentlemen as well as lady patients recover, at our Fountain Farm Cure, one-third faster than in the city of San Francisco. The climate here is the most even and bracing to be found in the State. The grounds command a view unsurpassed in the world. The Institution is furnished with an abundance of pure, soft water, from numerous springs; and we now offer to Ministers, Teachers, Lawyers, Miners, Merchants, Mechanics, Farmers, and all other worthy persons, who desire to try the advantage of the only *rational* system of medicine, the hospitalities of our Hygienic House and Cure. Young men who have become debilitated or lost their health by excessive toil, exposure, or enervating habits, contracted through ignorance of Physical Laws, may with us find more of the encouragements they need, and means that will restore them to health, than elsewhere in California.

We claim for Water-Cure and Hygienic Medication superior advantages over all systems of drug medication in the cure of all disorders, whether acute or chronic; that it is followed by none of those debilitating diseases, such as Piles, Chronic Diarrhœa, Torpid Liver, Constipation, intense Nervousness, Neuralgia, etc., nor those terrible Secondary Diseases, known as Varicose Swelling of the Veins, Necrosis, or Decaying of the Bones, Ulceration of the Limbs, Mercurial Rheumatism, Urethal Strictures, etc., which we well know result from the free use of mercury and other metallic drugs, together with stimulants and vegetable poisons given to overcome acute diseases.

The Oakland Water-Cure and Eye Infirmary is by far the most complete in its facilities for the cure of all diseases commonly treated in all Eastern Water Cures of any like establishment on this coast, and the only one in California conducted according to the Theory and Practice of the New York Hydropathic College. We use all forms of Warm and Cold Wet Sheet Packs, the Electro-Chemical Bath, Steam Baths, Improved Sitz Baths, Douch Baths, a Patent Spray Bath, and Baths. The last named was in-stituted by Dr. Smith with special reference to the cure of those diseases peculiar to miners, namely: Rheumatism, Inflammatory or Chronic, Stiff Joints, Paralysis, Mercurial, Lead, and Oak Poisonings. It is a sure cure for Ague and Fever. It aids more than any other Bath we have yet used in oradicating all kinds of drugs and infectious poisons, and in the cure of all disorders induced by exposure to dampness and water, foul air, absence of light and electricity, retorting metals, the malaria of rivers and low marshy grounds. Where there was a fair constitution left, even when drugs had been applied for months and years without R cure, we have, in the past seven years, treated successfully the following diseases: Chronic, Inflammatory and Mercurial Rheumatism; Paralysis; Lung, Bronchial and Catarrhal Affections; Diseases of the Heart, Kidneys, Liver; Dyspepsia, Constipation, Erysipelas, Scrofula, Piles, Inflammation of the Bowels, Chronic and Acuic Diarrhœa, and all diseases and weaknesses peculiar to male and females. No physician in California is so favorably situated to furnish so many home comforts and hygienic conditions that are indispensable to the speedy recovery of nervous and chronic invalids. We have the only truly healthful boarding place in the State for men, women and children, with plenty of saddle and carriage horses for the use of patients and boarders.

To that class of Diseases and Weaknesses peculiar to females, and the medication that Hydropathic or Hygienic physicians employ in their cure, do we invite the special attention of patients and their friends. The ease and rapidity with which females suffering from general or special debility, recover in the bracing climate of the Bay, under Hygeuic Medication, together with the universal success that has attended the treatment of females at Dr. Smith's Institutions, (both in Sacramento and San Francisco) has induced us to make this class of human afflictions a specialty of our Institution. We have treated (most in the cure), over 300 females, several of whom had been "bedridden" for months and years, and all have been decidedly benefited, and with but few exceptions, returned to their homes in from two to six weeks, so far recovered as no longer to need a physician. We have never yet learned of a single instance of a relapse into their former condition.

There is not one female invalid in twenty that has been suffering from nervous debility or diseases peculiar to her sex, that cannot be permanently cured by spending from four to six weeks at our Cure, and at the mere cost of $100. This statement we make in confidence, from an experience of the last seven years. From the many who have been treated at our Cure, we have yet to learn of a single regret from husband or wife of the time or means they have expended in Hygienic Medication.

NEW YORK, Aug. 1, 1858.

To all whom it may concern:

This certifies, that Dr. Barlow J. Smith is a graduate of the New York Hygieo-Therapeutic College, which College has a regular Charter from the Legislature of the State of New York, and is authorized to grant Diplomas, conferring on its students all and the same privileges and immunities in relation to the practice of the Healing Art, that are conferred by the Diplomas of any Allopathic or other Medical College in the country.

Dr. Smith has also devoted much attention to Phrenology, especially in its connection with Physiology and Pathology, a portion of the time under the instruction of Fowler & Wells, of this city, and has labored successfully as a teacher and lecturer on these subjects.

R. T. TRALL,
Principal New York Hygieo-Therapeutic College.

To all whom it may concern:

I have known Dr Barlow J. Smith, both in our office as a Student, and a practical Phrenologist in the country, and from what I know of him I can cheerfully recommend him as an honest, faithful delineator of character, and as such can cheerfully recommend him to the public.

For the good of science.

L. N. FOWLER, 308 Broadway, N. Y.

Dr. Smith spends a part of each day in San Francisco, attending to family practice and to Phrenological and Physiological examinations at his office, Room 13 Armory Hall, up stairs, corner Montgomery and Sacramento streets. Office hours from 11 A. M. to 2 P. M. Circulars sent on application. Address,

BARLOW J. SMITH, M. D.,
20v11tf San Francisco, Box 473.

A NEW VOLUME.

Fourteenth Year of Publication.

THE GOLDEN ERA.

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributers are all the best writers on this side of the Continent, and correspondents and contributors of distinguished ability in New York, Paris and London.

Miss BRADDON'S Greatest Sensation Story published from Advance Sheets:

RUPERT GODWIN;

—OR—

The Secret of Wilmindon Hall.

A NOVEL.

By Miss M. E. Braddon,

Author of "Lady Audley's Secret," "The Outcasts," "The Doctor's Wife," "Three Times Dead," etc.,

—IN—

THE GOLDEN ERA.

NOW IS THE TIME TO SUBSCRIBE!

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin: the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California and on the Pacific Coast, also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

"THOUGHTS AND THINGS"

APPEAR WEEKLY IN THE GOLDEN ERA.

Read "Thoughts and Things" in the GOLDEN ERA.
" Professor Clearquill." in the Golden Era.
" Dogberry," in the Golden Era.
" Alice Mason," in the Golden Era.
" Hugh Humphrey," in the Golden Era.

TO ADVERTISERS.

Best Advertising Medium.—The Golden Era is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village and mining and agricultural precinct in California, and offers unusual and unequalled advantages to those who desire to bring their business promiuently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

Opinions of the Press:

THE GOLDEN ERA.—We would call the attention of all newly-arrived Californians to this excellent weekly colemporary. We have seen the Era so frequently at the family fireside, and in the rude cabins of many industrious miners, that it would seem superfluous to recommend it to old Californians. It is the oldest literary journal on the coast. [S. F. Mining and Scientific Press.

THE GOLDEN ERA, which has just entered upon its fourteenth volume, is fully entitled to be considered as THE literary paper of the Pacific coast. Its proprietors understand the wants of the community, and furnish their readers with all the popular works of fiction as fast as the proof-sheets are received from the Eastern States and Europe, and with a greater variety of original matter in the line of light literature, than can be found in any similar paper on the continent.—[S. F. Alta California.

THE GOLDEN ERA has entered upon its fourteenth year of publication. How many competitors for public favor have been started during this time, and not possessing the freshness and originality of the GOLDEN ERA, have struggled through a short, sickly existence—at last to "flicker out"—almost unnoticed. No single paper in the State is more read and admired, and friends in the States appreciate it fully as highly as the thousands here who weekly scan its columns. It is no copyist, being in all its main features Californian, and unlike the "story papers" in general, its contents are interesting to all who take an interest in the literature of this coast.—[Napa Reporter.

THE GOLDEN ERA, as a good family paper, as a literary production, cannot be surpassed within the limits of America, and America beats the world in publication of first-rate literary papers. It is filled to overflowing with excellent reading matter, original and selected prose and poetry. It is now publishing, from advance sheets furnished from New York, two very interesting stories, each chapter of which is alone worth the subscription price of the GOLDEN ERA.—[Folsom Telegraph.

THE GOLDEN ERA is decidedly the best journal of the kind on this coast, and, we had almost said, in the United States. It is prepared with great care and labor, and publishes an immense amount of reading matter. The serial stories of the best authors are printed in its columns, and its local gossip is always pungent, racy and instructive.—[S. F. Examiner.

THE GOLDEN ERA is one of the best journals of its class in the whole country, and is carefully and intelligently conducted.—[S. F. American Flag.

THE GOLDEN ERA is enlarged by the addition of eight columns of reading matter. It was never more worthy the support of the reading public than at present.—[S. F. Morning Call.

THE GOLDEN ERA is decidedly the best family paper published in the State and we are pleased to learn that it is in a flourishing condition.—[Sacramento Bee.

THE GOLDEN ERA, as a strictly literary and news paper, is chief among the best. Its correspondence and editorials are of that originality of style so peculiar to this coast.—[Oregon Sentinel.

THE GOLDEN ERA is the best literary paper published on this coast. It abounds in stories both real and fictitious, which are worth a careful perusal by every one.—[Santa Cruz Sentinel.

THE GOLDEN ERA is as good a literary paper as can be procured on the continent.—[Red Bluff Independent.

THE GOLDEN ERA has entered upon its fourteenth volume. It is by far the best literary and family paper ever published on this coast.—[Sonoma Democrat.

THE GOLDEN ERA is a most ably conducted literary journal, in every way worthy of its large circulation, and characterized by a flow of wit and freshness of satire in dealing with the prominent follies of the age that is truly refreshing.—[Deseret News, Salt Lake City.

THE GOLDEN ERA is a fine family and literary paper, as the broad Union anywhere can boast of.—[Denver Rocky Mountain News.

THE GOLDEN ERA is the best family journal in the United States.—[Salt Lake City Telegraph.

THE GOLDEN ERA is a highly handsome quarto of fifty-six columns, comprising the freshest and the richest cream of American belles lettres. Nothing north or south, or east or west, can be compared to it as an elegant family and literary newspaper.—[Union Vedette, Salt Lake City.

THE GOLDEN ERA, instead of economizing during these dull times and presenting a paper to match the times, is as brilliant as ever. It has a talented corps of literateurs, and keeps fully up to the mark.—[S. F. Dramatic Chron.

THE GOLDEN ERA is now in its fourteenth year of publication, and is established on a firm basis. It has a larger number of regular contributors, and gives a greater variety of reading matter than any other paper of the kind published in San Francisco.—[Quincy Union.

THE GOLDEN ERA has commenced its fourteenth year with a steady improvement in literary and typographical appearance.—[Yreka Journal.

THE GOLDEN ERA began in the infancy of the State, and has grown with it, until there is now hardly a post office in the State, or on this coast, where it is not taken. It employs the best writers in the Atlantic States, in Europe, and in California.—[Colusa Sun.

BROCKWAY'S

PERPETUAL CALENDAR

Shows without hesitation

The Date or Day of the Week,

—or—

Any Day or Date in the 19th Century,

Rendering it a prompt and accurate

ASSISTANT RECKONER,

Besides answering fully
And Conveniently
All the Purposes of the
Ordinary Counting-House Calendar
During the Nineteenth Century.

The Calendar for each month is arranged in a single column, as in the regularly published (book) Almanacs, rendering it more easy for reckoning, in most instances, than the customary Counting-House form of Calendars.

It is simply understood.
It affords the same reference from year to year.
It avoids errors.
It occupies a convenient space.
Its usefulness increases by use.
Once used it becomes indispensable,
It is worth one hundred times its cost.

Its cost is trifling, but its value is constant and perpetual. For a single reference it is often worth ten times its cost. In FINANCIAL, LEGAL and BUSINESS transactions, it saves many grave and important mistakes.

New Mining Advertisements.

Continued Mining Advertisements will be found under another head

George Washington Gold and Silver Mining Company, Silver Mountain District, Alpine County, Cal. Assessment No. 10.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 20th day of February, 1866, an assessment of one dollar and fifty cents ($1.50) per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, only.

Any stock upon which said assessment shall remain unpaid on Saturday, the 24th day of March, 1866, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Tuesday, the 10th day of April, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

W. D. ROOT, Secretary.

Office, 338 Montgomery street, San Francisco.

NOTICE.—By an order of the Board of Trustees, made in the above Company, all the Certificates of Shares outstanding of the old stock are annulled, and have been replaced by issues of Certificates of the new stock, and parties are cautioned against purchasing any of the old Certificates, as they are all cancelled on the books of the Company, and all transfer of the same stopped.

feb24 W. D. ROOT,

Walipi Gold, and Silver Mining Company, Moss Lode, San Francisco Mining District, Arizona Territory.

Notice is hereby given, that the Annual Meeting of the stockholders of the Walipi Gold and Silver Mining Company, will be held at the office of the Company, No. 620 Washington Street, San Francisco, ON WEDNESDAY, March 21, 1866, at 12 o'clock M. Trustees will be elected, and other important business transacted.

feb24-4w H. B. CONGDON, Secretary.

Office, No. 228 Front street, San Francisco, Cal. feb10-4w

United States Mining Company.---Location: Virginia District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 7th day of February, 1866, an assessment of fifty (50) cents per share was levied on each and every share of the capital stock of said company, payable immediately, in gold or silver coin of the United States, to the Secretary, at his office, or to F. A. Marston, Virginia, Nevada.

Any stock upon which said assessment shall remain unpaid on Saturday, the 17th day of March, 1866, will be advertised as delinquent, and unless paid, will be sold on Saturday, the 31st day of March, 1866, to pay said delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, No. 10 Government House, corner Sansome and Washington streets, San Francisco. feb10

Wide West Gold and Silver Mining Company. Location: Silver Mountain District, Alpine County, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 4th day of January, 1866, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Trustees, made on the said 4th day of January, 1866, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., at No. 626 Montgomery street, San Francisco, Cal., on the 21st day of February, 1866, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JOSEPH GREEN, Secretary.

Office, 330 Davis street, San Francisco. feb3

POSTPONEMENT.—The above sale is hereby postponed until Friday, March 2, 1866, at the same hour and place. By order of the Board of Trustees.

feb10 JOSEPH GREEN, Secretary.

HIGH RENTS.—The New York *Express* gives the following list of rents in that city:

Twenty-eighth st., near 5th avenue,	$650	per month.
Eleventh street, nicely furnished,	550	"
Forty-fourth st., 20x60 feet	600	"
Forty-seventh street, 20x40 feet,	300	"
Fifth avenue, large and elegant,	1,200	"
Union Square, house and stable,	1,100	"

A house on Union Sqnare, (old-fashioned style, not very remarkable for anything) rented for $1,000—$12,000 per annum, about half of the salary of the President of the United States.

THE LATE FLOODS have done immense damage in Solano, Yolo and Yuba counties. The levees constructed under the Swamp Land Law have been of no nccouut.'

J. B. CONE, BUSINESS AGENCY.—Makes private sales of Property and Business Places of every description, in the city and throughout the State; procures partners with large and small amounts of money; negotiates sales o mniug property, and does a General Agency Business. Patronage solicited by mail, express, or by personal application at the office, 402 Montgomery Street, San Francisco, California. 23v11tf

FOR SALE.

Owing to the great distance from our point of manufacture. we offer for sale the State Right of California for our

Patent Boring Tools for Artesian Wells,

Illustrated upon the first page of this paper February 17th. These Tools are now in use in the various Oil Regions of Pennsylvania, Ohio and Virginia; and although but just introduced, are universally approved and admired, and bid fair to become eventually the most popular tools in use. We shall close without reserve to the party sending us the highest bid, to whom we will mail a complete set of Drawings, copy of Circulars, etc.

Address, fully,

A. A. WILSON,
Morgan Iron Works,
7v12tf Foot 9th street, East River, New York City.

GEORGE E. BROWN,

(Late Assistant Examiner in the U. S. Patent Office,)

HAVING RESIGNED THAT POSITION AFTER A TEnure of office of eighteen months, offers his services to

INVENTORS AND THEIR ASSIGNEES,

—AS A—

Patent Solicitor,

He will make Preliminary Examinations in the Patent Office, with a view to ascertain the Patentability of any invention that may be submitted to him for that purpose; will prepare the necessary papers for those who wish to make Applications for

Patents for their Inventions,

—OR FOR—

EXTENSIONS OR REISSUES OF PATENTS

Already granted; will act as an Attorney in presenting Applications at the Patent Office, and in managing them to a final issue; will draw up Assignments; will examine into the condition of Rejected Applications when desired to do so, and undertake the prosecution of such as may be considered patentable, and do whatever else is usually done by Patent Solicitors.

Address, P. O. Box 257, Washington, D. C. 7v12-3m

ANNUAL REPORT
—OF THE—
Pacific Insurance Company.

IN COMPLIANCE WITH THE ACT OF THE LEGISLAture of the State of California, entitled "An Act concerning Corporations," passed April 22, 1850, the Pacific Insurance Company of San Francisco makes the following Annual Report:

I.—The amount of the Capital Stock of this Company is SEVEN HUNDRED AND FIFTY THOUSAND DOLLARS, and paid in GOLD.....$750,000

II.—The amount of the Assets is ONE MILLION AND FIFTY-ONE THOUSAND, FOUR HUNDRED AND TWENTY DOLLARS AND THIRTY-SEVEN CENTS..$1,051,420.37

III.—The Company has NO DEBTS.

IV.—The amount of insurance effected during the year, and which remained in force December 31, 1865:

Fire.....	$12,973,949
Marine.....	434,403

This Company commenced underwriting Marine Risks, August 1, 1865:

V.—This Company insures against the following risks, viz.: BUILDINGS, HOUSEHOLD FURNITURE, MERCHANDISE, RENTS, LEASEHOLDS, VESSELS IN PORT AND THEIR CARGOES, and other PERSONAL PROPERTY, AGAINST LOSS OR DAMAGE BY FIRE.

Also, on CARGOES, TREASURE, COMMISSIONS, PROFITS, and WAR RISKS, and ON ALL MARINE AND INLAND NAVIGATION RISKS, TO AND FROM ALL PORTS IN THE WORLD.

VI.—This Company will take on any FIRST-CLASS RISK not to exceed $75,000 (the limit fixed by law), and on all large risks will reinsure to an extent consistent with PRUDENCE in other RESPONSIBLE COMPANIES.

J. HUNT, President.
A. J. RALSTON, Secretary.

THE EXCELSIOR
GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and o, Openings,

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,
WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

HENDY'S
IMPROVED BLOW-PIPE.
This Convenient Helpmeet
—TO THE—
ASSAYER, CHEMIST, DENTIST, JEWELLER, PROSPECTOR AND MILLMAN,

Can now be procured, at the Patentee's price, by sending your orders, by mail or otherwise, to the

Office of the Mining and Scientific Press.

This article was more fully mentioned in the Press of April 15th, 1865. Since that time, however, Mr. Hendy has made a further improvement by attaching a rubber hose between the mouth-piece and the pipe, enabling the blower to change his position without disturbing the direction or constant accuracy of the current on the object upon which it is turned. The main portion of the blow-pipe is made with a joint, at which a valve is placed, which is opened when the operator blows and closed immediately when he ceases. By this arrangement the little bag or bladder is readily filled at a single breath, and with very little exertion. When so filled, a continous current of air is forced from the nozzle of the pipe by the mere contractive force of the gutta percha. This force is uniform until the air is very nearly exhausted. The current may be easily varied or entirely cut off by gently pressing the fingers upon the neck of the bladder above the nipple to which it is attached.

Price, Complete.....$5.00.

Machinery.

HUNTER'S
PREMIUM
CONCENTRATOR, AMALGAMATOR
AND SEPARATOR,
Awarded a Silver Medal at the late Mechanics' Fair.

Hunter's Concentrator can be seen in operation daily at the Novelty Iron Works, Fremont street. Parties wishing to purchase Concentrators will find it to their advantage to examine the above machine before purchasing elsewhere, for the following reasons:

1st. It will work the sands from a 5-stamp battery, and save from 10 to 20 per cent more sulphurets than any machine built on the Pacific coast.

2d. The Sulphurets are washed clean, containing less than ten per cent. of sand.

3d. The waste free gold and amalgam is amalgamated on the copper plates; not a particle of ground mercury and scarcely a trace of metal passes off with the sand.

4th. Its simplicity is a sufficient recommendation for its general use as a Concentrator. The variation of speed in a Quartz Mill does not effect the working of the Machine. The same was demonstrated at the late Mechanics' Fair, when with the greatest irregularity of speed the best of results were given.

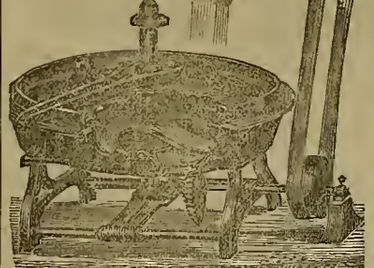
5th. There is no clogging or stopping to clean out the sulphurets and sand; consequently no waste from any inattention on the part of the attendant

6th. In exhibiting the working of the machine if it is not run empty, all classes of ores and tailings, from 50 pounds and upwards, are concentrated that parties may see fit to test the machine with.

Give it a trial, and satisfaction is guaranteed All orders and any information required, address,

ANDREW HUNTER,
Novelty Iron Works, Fremont st., San Francisco,
15v12-3m Or to E. T. STEEN, Agent.

BAUX & GUIOD'S
Separator & Amalgamator



Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine Scientific Knowledge with Practical Experience, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; its small cost; its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crall's Gravel Cement Works, Nevada county; Waltham's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Hengh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6df

Hepburn & Peterson's
AMALGAMATOR.

The subscribers would call the attention of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, 141 St. bet. 3d and 4th. [Illustrated in the Mining and Scientific Press, April 9th, 864.]

HUNT'S
IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN
HORSE POWER
For Sawing Wood.
ALSO, THE
Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.
☞ For further Particulars see small circulars. ☜

Portable Steam Engines!
"Houdlry's" and "Hittinger's" Make,

COMBINING THE MAXIMUM OF EFFICIENCY, Durability, and Economy, with the Minimum of Weight and Price.

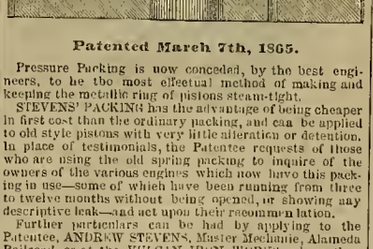
These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.

Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of milling enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Grist Mills.
For sale by TREADWELL & CO.,
3v12-3m Corner of Front and Market streets.

Stevens' Pressure Packing.



Patented March 7th, 1865.

Pressure Packing is now conceded, by the best engineers, to be the most effectual method of making and keeping the metallic ring of pistons steam-tight.

STEVENS' PACKING has the advantage of being cheaper in first cost than the ordinary packing, and can be applied to old style pistons with very little alteration or detention. In place of testimonials, the Patentee requests of those who are using the old spring packing to inquire of the owners of the various engines which now have this packing in use—some of which have been running from three to twelve months without being opened, or showing any descriptive leak—and act upon their recommendation.

Further particulars can be had by applying to the Patentee, ANDREW STEVENS, Master Mechanic, Alameda Railroad, or at the VULCAN IRON WORKS, where they can be seen, at any time, in course of construction.

10df ANDREW STEVENS.

FOR SALE!
A STEAM ENGINE!

10-INCH CYLINDER, FOUR-FOOT STROKE, IN PERfect Order. Can be seen running at the San Francisco Pioneer Woolen Factory, Black Point. Inquire at VULCAN IRON WORKS, 137 and 139 First street, or to

HEYNEMANN & CO.,
26v11tf 311 and 313 California street.

WATER WHEELS!
Equal to the Best Overshot Wheel

POWER PLEDGED

IN EXISTENCE.

LEFFEL'S
AMERICAN DOUBLE TURBINE

Is now manufactured by the Vulcan Iron Works Company, in this city, and orders for the same can be filled immediately. We have a large supply of the different sizes, from 10 inches to 30½. That we may know the proper sized Wheel you require, measure your water in the following way: Take the width of the stream, the average depth and the distance it flows in a minute.

All the Wheels already in use give universal satisfaction. For particulars send for a Circular.

This Wheel is especially adapted to mining purposes. It is light, and can be easily packed into the mountains. Wheels weighing from 50 to 300 pounds, will yield from 10 to 40 horse-power under a head of 25 or 30 feet. They are the cheapest wheel to set up known, as they are so arranged as to produce the greatest power possible from the water used.

Come and see them, or send for a Circular to

LEFFEL & MYERS,
At Vulcan Iron Works, office 137 and 139 First street, San Francisco. 4v11tf

VARNEY'S
PATENT AMALGAMATOR.
These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the PACIFIC FOUNDRY,
1v1 San Francisco.

Prater's Patent Concentrator
(Known as HUNGERFORD & PRATER'S Concentrator,)
MANUFACTURED AT THE
San Francisco Foundry and Steam Engine Works.
Corner Fremont and Mission Streets.
All orders promptly attended to.

HUNT'S PATENT
Circular Sweep Horse-Powers,

For running Churns, Washing Machines, Grindstones, pumping water, sawing wood, and other light machinery. Price, $100, at the Factory.

HUNT'S PATENT SELF-REGULATING TREAD HORSE-POWER is superior to any machine of the kind in the market. Price, with Governor, all complete to set to work, at the Factory, $300. Manufactured by

E. O. HUNT,
7v10 28 Second street, San Francisco.

Important to Miners.
NEW PATENT! ROASTING PROCESS.

I am now prepared to offer to the mining community a New Roasting Process, which has been approved as novel and beneficial by the best authorities in Europe. A Furnace can be erected in a few days at a trifling expense, and one man is able to Roast ten tons of Ore or Concentrated Sulphurets per day.

MORE COMPLETELY AND CHEAPER

Than any other Process. All the Sulphur is saved, by being converted into Bisulphide of Carbon, which is a valuable product, and will pay nearly all expenses.

For particulars, apply to

J. MOSHEIMER,
25v11-3m 423 Washington street.

SALMON'S
PROPELLOR AMALGAMATOR
—AND—
Challenge Settler

Has been in use and thoroughly tested, both in California and Nevada, with entire satisfaction to all parties concerned. These Machines are

Made entirely different from any others,

And with the same power will grind, amalgamate, settle and separate, more gold and silver ore than any others now in use. Manufactured at the SAN FRANCISCO FOUNDRY where Machines can be seen in operation. Address

J. & W. C. SALMON.

Economy in Advertising.—The Mining and Scientific Press is the best and most economical mining advertising medium in this city. Our terms are less than one half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

"The California Youths' Companion."

The following article from the *Youths' Companion*, of last week, fully explains itself:

The proprietorship of the undersigned in the YOUTH'S COMPANION, closes with the present number. Hereafter, Messrs. DEWEY & Co., of the *Mining and Scientific Press*, will assume its publication. The principal object we have had in view in making this arrangement, has been to promote the interests, and give additional value to the little paper we have established and conducted, thus far, for the amusement, instruction, and benefit of the youth of California.

The usual difficulties a new publication has to contend with in starting, and what is more important—in *continuing*—have been fully experienced by the projector of this enterprise, yet the kind words and cheerful interest of many true friends, has made the sacrifice a pleasant one. The gentlemen into whose hands the paper has now passed, have more extended means and facilities for making it what it should be, than we could command, hence the change. While our proprietorship ceases, our interest and efforts in behalf of the paper will still continue. At the request of the new proprietors, we shall continue, for the present, to look after the outside interests of the COMPANION, and on the issue of the next number shall visit, in succession, the Schools throughout the city, for the purpose of securing for it a more extended circulation among the youth of San Francisco, and eventually throughout the State. The subscriptions of all who have subscribed by the quarter, expire with the present number, and we trust that they will he prepared for renewal when we reach them.

The well-knowu position which the new proprietors hold in the city and State, as the publishers of a journal devoted more especially to the purpose of diffusing useful and iustructive information, is a guarantee quite sufficient to warrant the assumption that the readers of the YOUTHS' COMPANION, will lose nothing by the contemplated change; but on the other hand, will find a marked increase in the value and interest which will hereafter attach to its columns.

With thanks to all, but more especially to the Teachers in the department, who have afforded us every facility and assistance for the circulation of our paper, we submit it to other and abler hands. FRANK SMITH.

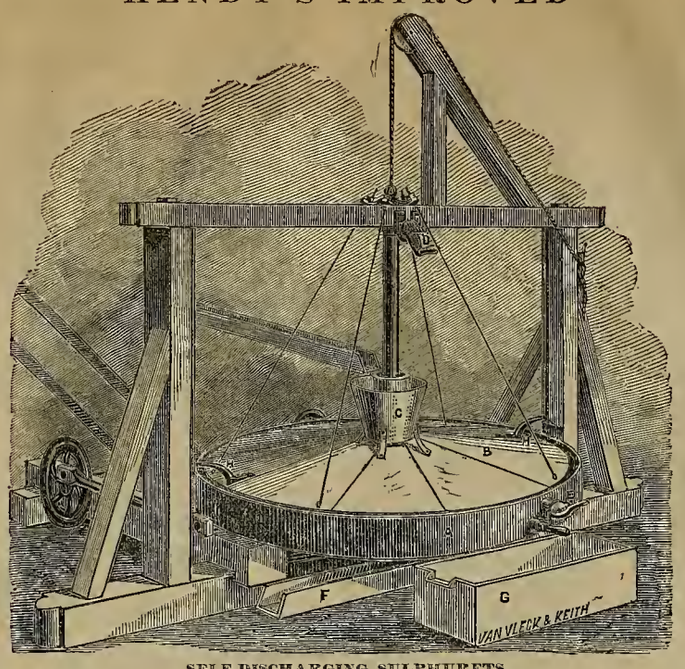
HENDY'S IMPROVED



SELF-DISCHARGING SULPHURETS
PRATER CONCENTRATOR
Is Receiving Universal Favor.
NOTICE TO QUARTZ MINERS:
Reference is made to the following Mills which are using the Prater Concentrator, with some of the improvements attached. The Self-Discharging Sulphurets has been more recently adapted, and the public attention is called to examine its workings:
STEPHENS' MILL, Humboldt County, Nevada.
CHRYSOPOLIS MILL, " " "
U. S. REESE RIVER MILL, Austin, "
CARROL & ASPINWALL MILL, Reese River, Nevada.
UNION MILL, El Dorado County, near Mud Springs.
NEW YORK AND EL DORADO CO., " "
BLUE LEDGE MILL, near Spanish Flat, El Dorado Co.
CONEY MILL, Jackson, Amador County.
Messrs. TUBBS & CO'S MILL, San Andreas, Amador Co.
WINTER'S MILL, Angels Camp, Calaveras County.
CLIO MILL, Jacksonville, Tuolumne County.
And in use in other parts of this State; also in Idaho, Arizona, Colorado and Mexico.
As a further evidence of its worth, two of these Concentrators were ordered recently by Messrs. Goddard & Co., of this city, for their Mill (Independence Mill), near Sonora, Tuolumne County, which are now being fitted up at the Pacific Foundry. The parties have extensive experience in quartz machinery, and have concluded to use these Concentrators in preference to all others.
A further order for a Concentrator from Messrs. Bigelow & Bro., of this city, who are now using two Concentrators at the Coney Mill, Jackson, Amador County.
They may be seen in operation at the GOLDEN STATE FOUNDRY, No. 19 First Street, San Francisco.
☞ For explanation of the above engraving, and other particulars, send for a Circular.

Pacific Mail Steamship Co.
The following Steamships will be dispatched on the following named days.

February 28th—COLORADO.....Capt. Jas. T. Watkins.
Connecting with HENRY CHAUNCEY, Capt. Gray.
From Folsom street Wharf
At 11 o'clock A. M., punctually to the hour,
For Panama.
Passengers will be conveyed from Panama to Aspinwall by the Panama Railroad Company, and from Aspinwall to New York in the splendid steamships of the PACIFIC MAIL STEAMSHIP COMPANY.
Steamers of this line will be dispatched the 10th, 19th and 30th of each month When these dates fall on Sunday, the steamer will leave on Saturday preceding.
Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.
Departure of 19th connects with French Trans-Atlantic Co's steamer for St. Nazaire, and English steamer for South America.
Departure of 10th connects with English steamer for Southampton, and steamer running to Guayaquil, touching at Tumaco, the port of the new mines, and P. R. R. Co.'s steamer for Central America.
Cabin passengers will be berthed through. Baggage checked through—100 pounds allowed each adult.
An experienced Surgeon on board. Medicine and attendance free.
These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.
For merchandise freight apply to Wells, Fargo & Co.
For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff strees.

A. W. HALL'S DRY PULVERIZER.

The accompanying engraving represents a novel mill for pulverizing ore to an impalpable powder in a dry condition; and from the reports of its practical operation where it is now in use, at the New York Quartz Company's Works, 48 East Twenty-sixth street, New York, it appears to be a success.

The general design of the machine is, to pulverize ore, or other material, in an air-tight chamber, and separate the fine from the coarse by blowing it out into a receiver, by means of a fan blower. In this way the fine particles, as fast as produced, will be carried off, leaving only the coarser particles, to be further operated upon by the machine.

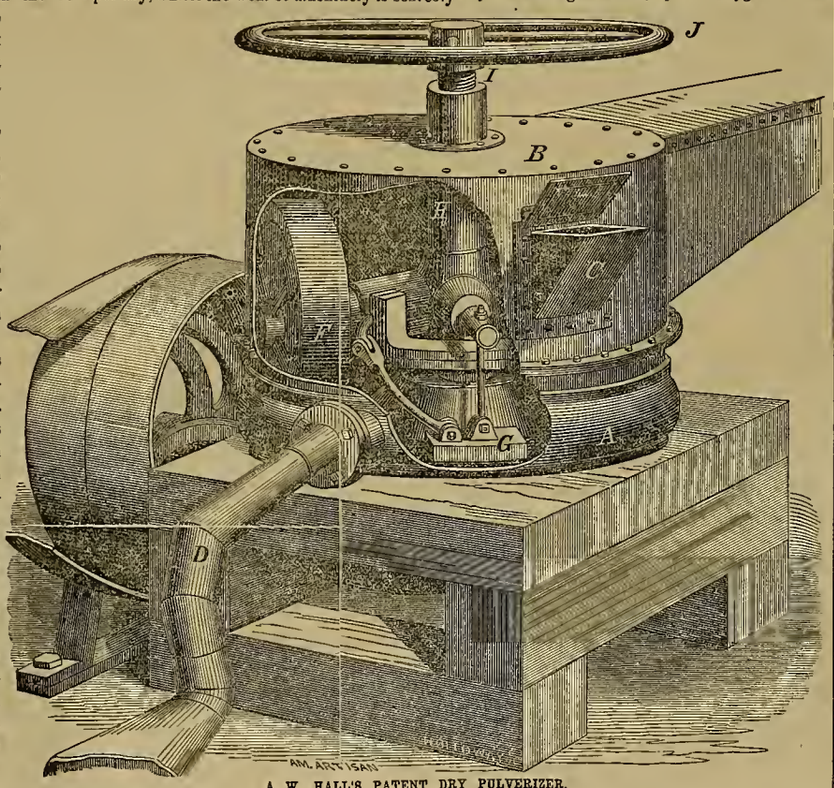
In this machine the Chilian wheels and the Spanish arrastras are employed in an ordinary cast-iron pan. The crushing surfaces of the wheels and arrastras are made convex, with a corresponding concave valley in which they travel, the working surfaces being of Franklinite iron. A dome, B, of sheet-iron, is made to cover the crushing and pulverizing apparatus, and secured to the flange of the pan, allowing space for the machinery to revolve. The material to be crushed is fed into the machine through the hopper, C, which is provided with two doors, one only of which is opened at a time to prevent the escape of the air and dust. The air passes from the blower through the tube, D, and enters a pipe, A, which surrounds the lower part of the pan. From this pipe there are thirty or forty five-eighths-inch holes leading into the pan, directly under the crushing wheels, which conduct the air in jets, and stir up the ore, and constantly keep the coarse separated from the fine powder, which is carried out through the spout, E. The receiver into which the dust is carried should be so large and so high as to allow the dust to settle and not be carried off.

The wheels are moved by means of bevel-gearing connected with the upright shaft, H, shown by part of the dome being broken away, which carries around the wheels, while they are free to rise and fall without cramping. This is effected by a double funnel-shaped hole through the centre of the axle, while the arms which bear against the axle are secured to the shaft.

The hand-wheel, J, bears against a rubber spring, I, which can be screwed down to increase the pressure of the wheels when desired, thus enabling the operator to gauge the crushing power of the wheels to correspond with the driving power of the engine.

The general features of this process of crushing and separating ore are applicable to the ordinary stamp-mill which has been patented by the same inventor, and was practically demonstrated by him in Colorado Territory in 1860.

The power necessary to drive one of these mills, including blower, will not exceed five horses. It will crush the hardest rock to absolute flour, at the rate of two-and-a-half tons per day, whilst the wear of machinery is scarcely



A. W. HALL'S PATENT DRY PULVERIZER.

perceptible, the only parts liable to wear being easily replaced.

A company is now being formed to use these mills for crushing barytes as a substitute for white lead, also felspar as a fertilizer, and to manufacture the machines for pulverizing gold and silver ores.

Persons wishing to purchase the patent for the State of California, for the use of the atmosphere as a separator of pulverized ores, either in the stamp mill or the one represented in the cut, or obtain any information concerning the invention, can address A. W. Hall, patentee, Tarrytown, N. Y.

While workmen were recently engaged in fixing up the Pacific Mail Steamship Constitution, lying at Mare Island dock, they found in her hulk a piece of a sword fish's sword stuck into the hard timber to the depth of several inches. The fish probably mistook the vessel for a whale.

ANOTHER MINING SCHOOL.

We took occasion, on Monday last to visit the Laboratory and Lecture Room, recently fitted up at the College of California, at Oakland. The laboratory is provided with a furnace and all the necessary appliances and fixtures for the accommodation of students in chemistry and assaying. We alluded last week to the delivery of the introductory lecture, by Prof. Blake, upon the subject of "Science and Scientific Schools, in their relation to Mining, Agriculture and the Kindred Arts." We had the pleasure, on Monday of listening to the introductory lecture to the chemistry course, by the same gentleman, upon "Oxygen." The subject was handled in a familiar and interesting manner, and fully illustrated by the usual experiments. This series of lectures will embrace incidentally the principal applications of chemistry in the arts and in metallurgy, and will be illustrated throughout by experiments.

The lectures on Mineralogy and Geology will be partly illustrated by the collection of the college, and that of the director, recently increased by the arrival of his collection from the East. The following is a general outline of the course: Common Minerals and the rocks which they form. Principal Ores of Iron, Copper, Lead, Silver, Gold, and other metals; their varieties, appearance, and methods of distinguishing them. Gems and Ornamental Stones. Historical Notice of the use and purposes of Geology; Geology a History; The succession of Life upon the Earth; Coal Formations; Movements of the Earth's Crust—Volcanoes, Earthquakes; Mineral Veins, their variety and origin.

On the subject of Mining, an introductory lecture will be given on "The Necessity of Education to a Mining Engineer." The general course will embrace: The Irregular Distribution of Ore in Veins; examples from the principal mines of the world; Association of Minerals and Ores; General study of Mining Plans, with a view to the proper opening and development of Mines; Timbering of Mines; Ventillation; Drainage; Hoisting; Mills for Working Ore—their construction, cost, and management; crushing, stamping, grinding and amalgamating machinery; concentration of ores, etc.

This course of instruction will be known as the "Department of Science and Arts of the College of California," and will be under the immediate direction of Prof. Wm. P. Blake, a gentleman in every way fully qualified to fill with credit such an important position.

For the Colorado.—Fourteen former residents of El Dorado Cañon leave this city today by the Los Angeles steamer, *en route* for the Cañon. Twenty-five tons of supplies left for the same destination, by a sailing vessel, a few days since, and more will soon follow. Among the party leaving, as above, are several connected with the Colorado Mill Company. These parties will start up the mill again immediately after their arrival, having made a contract with the Techatticup Company, for crushing their rock, on a percentage of its yield. This rock is known to be rich. This and that from the Queen City mine was the rock from which the large amount of bullion was taken to which we alluded some weeks since, as the first bullion from El Dorado Cañon.

Mr. Hazen Kimball, a well known artist of this city goes down on the steamer, and will visit the principal localities along the Colorado, for the purpose of taking sketches, which he will subsequently produce on canvass. Mr. Frank S. Alling, who holds the appointment of Postmaster at El Dorado Cañon, also goes down on this steamer. He informs us that he expects to be in regular receipt of the mails from this city by the first of July next.

Some of the principal merchants of San Francisco have made arrangements to ship a large quantity of goods to Callville, where proper storehouses will be erected, and at which point traders from Salt Lake and intermediate points, also from Western Montana and portions of Nevada and Arizona can be most conveniently supplied with goods of every description, at more reasonable rates than they can be obtained through any other channel. This supply will be constant, and must prove a great convenience to the vast extent of country intervening between the Rocky Mountains and Sierra Nevada; and by it San Francisco will lay the foundation of a business from which she must eventually reap immense commercial advantages.

It is easy to say, "Know thyself," but who is to introduce you? Most people go through life without making the advantageous acquaintance in question.

Grief knits two hearts in closer bonds than happiness ever can; and common sufferings are far stronger links than common joys.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

THE TRACTORY CURVE, AND THE PROPERTIES OF GRINDING PLATES.

BY W. A. GOODYEAR.

[continued from page 114.]

To find the surface of revolution generated hy the curve in revolving about the axis of x.

Denote this surface by S.

The general formula is $\frac{dS}{dy} = 2\pi y \frac{ds}{dy}$.

From (25) $\frac{ds}{dy} = \pm \frac{a}{y}$. Therefore,

(32) $\frac{dS}{dy} = \pm 2\pi a$. Integrating (32), we have

(33) $S = \int \pm 2\pi a\, dy = \pm 2\pi a y + C$.

The arithmetical value of the integral in (33), taken between the limits $y = 0$, and $y = a$, is $2\pi a^2$. This is the surface generated hy either of the two branches of the curve which lie on the same side of the axis of y. The total surface generated is, then, $4\pi a^2$ = four circles with radius a.

To find the volume of the solid of revolution generated by the curve in revolving about the axis of x,

Denote this volume hy v

The general formula is $\frac{dv}{dx} = \pi y^2$.

Now, $\frac{dv}{dy} = \frac{dv}{dx} \times \frac{dx}{dy}$. Therefore,

(34) $\frac{dv}{dy} = \pi y \sqrt{a^2 - y^2}$. Integrating (34) we have

(35) $v = \int \pi y (a^2 - y^2)^{\frac{1}{2}} dy =$

$$-\frac{\pi}{3}(a^2 - y^2)^{\frac{3}{2}} \times C.$$

Taking the integral between the limits $y = 0$ and $y = a$, we have the whole volume of the solid generated by either of the two branches of the curve which lie upon the same side of the axis of y, which is $\frac{\pi}{3} a^3$. The total volume generated hy the curve, is then $\frac{2}{3} \pi a^3$ = a hemisphere, whose radius is a.

To find the radius of curvature for the tractory,

Denote the radius of curvature hy r.

The general formula is

$$r = \frac{\left\{1 + \left(\frac{dx}{dy}\right)^2\right\}^{\frac{3}{2}}}{\frac{d^2x}{dy^2}}, \text{ and}$$

in using this formula, it is proper to give to the radical in the numerator the same sign as $\frac{d^2x}{dy^2}$ has, so that r may be always positive. Doing tbis, and suhstituting the values of $\frac{dx}{dy}$ and $\frac{d^2x}{dy^2}$ from (3) and (21), we have

(36) $r = a \frac{\sqrt{a^2 - y^2}}{y}$.

To find the evolute of the tractory.

The evolute is the locus of the center of curvature. From the manner in wbich the general formula for the radius of curvature is obtained, we know tbat if x' and y' be the coördinates of the center of curvature corresponding to the point x, y of the original curve or involute, then the two following equations are true, viz.:

(37) $y - y' + (x - x')\frac{dx}{dy} = 0$;

(38) $1 + \left(\frac{dx}{dy}\right)^2 + (x - x')\frac{d^2x}{dy^2} = 0$.

Now, $\frac{dx}{dy}$ and $\frac{d^2x}{dy^2}$ are known in terms of y: Hence, in (37), (38) and (18), we have three equations, between whicb, if we eliminate x and y, we shall obtain a fourth equation, expressing the relation between x' and y', which is the equation of the evolute. This we proceed to do.

Substituting in (37) and (38) the values of $\frac{dx}{dy}$ and $\frac{d^2x}{dy^2}$ already known, these equations become, respectively,

(39) $y - y' \pm (x - x')\frac{\sqrt{a^2 - y^2}}{y} = 0$, and

(40) $1 + \frac{a^2 - y^2}{y^2} \mp (x - x')\frac{a^2}{y^2\sqrt{a^2 - y^2}} = 0$.

Simplifying equation (40), it becomes

(41) $\sqrt{a^2 - y^2} = \pm (x - x')$, or,

(42) $x = x' \pm \sqrt{a^2 - y^2}$.

Substituting the value of $\pm (x - x')$ from (41) in (39), the latter becomes

(43) $y - y' + \frac{a^2 - y^2}{y} = 0$. Solving (43) with respect to y, we have

(44) $y = \frac{a^2}{y'}$, therefore,

(45) $\sqrt{a^2 - y^2} = \sqrt{a^2 - \frac{a^4}{y'^2}} = \frac{a}{y'}\sqrt{y'^2 - a^2}$

Substituting this value of $\sqrt{a^2 - y^2}$ in (42), it becomes

(46) $x = x' \pm \frac{a}{y'}\sqrt{y'^2 - a^2}$. We have now in (44) and (46) the values of x and y in terms of x' and y'.

Substituting these values in (18), we obtain

(47) $x' \pm \frac{a}{y'}\sqrt{y'^2 - a^2} =$

$$\pm \left\{ \frac{a}{y'}\sqrt{y'^2 - a^2} + \frac{a}{2} \log_e \frac{a - \frac{a}{y'}\sqrt{y'^2 - a^2}}{a + \frac{a}{y'}\sqrt{y'^2 - a^2}} \right\}$$

Removing the parenthesis from the second member of (47), and cancelling the equal terms with like signs upon opposite sides, we obtain

(48) $x' = \pm \frac{a}{2} \log_e \frac{a - \frac{a}{y'}\sqrt{y'^2 - a^2}}{a + \frac{a}{y'}\sqrt{y'^2 - a^2}}$

$$= \pm \frac{a}{2} \log_e \frac{y' - \sqrt{y'^2 - a^2}}{y' + \sqrt{y'^2 - a^2}}$$

which is the equation of the evolute. Equation (48) may be put into the form

(49) $y' = \pm \frac{a(1 + e^{\frac{2x'}{a}})}{2e^{\frac{x'}{a}}}$, Moreover, (49), by a very simple change of form, becomes

(50) $y' = \pm \frac{a}{2}\left(e^{\frac{x'}{a}} + e^{-\frac{x'}{a}}\right)$ whicb is the equation of two equal common catenaries, one upon each side of the axis of x, and having their vertices respectively at the points $y = a$, $x = 0$, and $y = -a$, $x = 0$, tbe one above the axis of x being upright, and the one below it inverted. (See Todhunter's Analytical Statics, page 201.)

D' Alembert is, therefore, right in saying that the evolute of the tractory is the common catenary, in spite of the assertion upon page 93 of the Quartz Operator's Hand-Book. As to the remark tbat the equations of the tractory and catenary are essentially different, it is very true they are. But this fact alone is not sufficient (as it is there assumed to be) to enahle us to decide, or even to guess, beforehand, what the *evolute* of the tractory may or may not he. It is the general *rule* and *not* tbe exception that a curve and its evolute are essentially dissimilar to each otber. The cycloid is an exception to this rule. Tbe tractory is not, as I have shown.

[To be Continued.]

[Written for the Mining and Scientific Press.]

Electricity the Cause of Earthquakes.

BY W. WADSWORTH.

Before discussing the above proposition—using the plural—we will endeavor to define what electricity is.

We believe it to be a fluid, exceedingly subtle and elastic, more so tban any of tbe known gases; in its motions as rapid as light, and like heat, may be either active or latent; when active, sometimes visible; when latent, invisible, and is a principal agent employed by Diety in producing some of the most wonderful phenomena of nature—and among them, earthquakes.

Books have taugbt us that there is a positive and a negative terrestrial electricity. In all our varied experiments we have never been able to discover but one. We might as well say that heat and cold are both heat, only that the one—heat, is positive; and cold, negative. *Plus* and *minus*, are terms better adapted to tbe conditions of terrestrial electricity. The earth is one vast reservoir of latent electricity; and all bodies connected with it, unless acted upon by local excitants, would contain just their share of latent electricity—no more—no less. The electricity of tbese bodies would then be neither plus nor minus. But suppose one of these bodies to be insulated from the earth by wbat electricians recognize as a non-conductor; now, if with a common electrical machine, we charge this insulated body with more than its natural quantity, it is then plus, just that quantity, and the whole earth apart from it, becomes minus just tbat quantity; but if by a conductor the connection between the insulated body and the earth is renewed—the equilibrium is restored, and neither can be said to be plus or minus.

By latent and active electricity, we mean that, the electricity held by a body insulated and charged highly, or plus, if no conductor approach it, is as perfectly invisible as though tbe body had only its natural share—neither light or heat is evolved; and this is latent electricity. Now let another body—if not also plus—approach the body which is insulated and plus, and electricity in sparks or a continuous stream of flame passes from the latter to the former, evolving both light and heat; and this is active electricity.

Electricity may be latent in the earth or the clouds, and be wholly invisible; but let it pass through the air—a non conductor—and it becomes active, and is the "lightning;" thunder being only the noise produced by its passage through or along a non-conductor; we would not advert to this, which every school-boy is supposed to know, only that we may have occasion to connect the simple fact with our explanation of the rumblings attendant upon earthquakes.

We started with the proposition that the earth was one vast reservoir of latent electricity, liable however to have its equilibrium disturbed in places by local causes; when this takes place, one portion of tbe earth may become largely plus in quantity, and this necessarily gives us another portion as largely minus. Tbat this is the case is quite clearly demonstrated in tbe "thunder storm," whicb—tbrough the agency of clouds—conveys the plus electricity of one portion of the globe and deposits it in the "lightning" upon another—which is minus; or the clouds may be minus, and passing over a district of country largely plus, the "lightning" may pass from the earth to the clouds, as several well-authenticated instances clearly prove.

We might enumerate several of tbe causes that tend to disturb the equilibrium of the earth's electricity, producing in one portion a vast excess over another, thousands of miles distant; but it seems unnecessary to go into elaborate argument to prove what no one doubts. We would however in this connection remark, that, a recent writer on the subject of the Atlantic telegraph, gives it as bis opinion that, to insure perfect success, a return cable to the point at which the battery is applied will be found necessary, for the reason that, suppose tbe battery be applied in Ireland, and reliance is placed upon the waters of tbe ocean for the return current; now if the two countries should happen to be at all times exactly in equilibrium there would be no difficulty; but suppose the American side happened at the time to be largely minus, the entire charge from the European battery would be absorbed by the minus of tbe American side, there could then be no return current, and imperfect working or total disappointment must ensue.

We present the argument here only as another proof showing the now very general belief among electricians that, different countries of the earth possess at times a greater proportion of the earth's electricity than others, though directly connected by water, a very good conductor under ordinary circumstances, though not equal to a metallic one.

We will now examine some of the phenomena of the earthquake, and then see if there is any other agent than electricity, that can possibly produce them all. One fact has been very generally overlooked by writers on the causes and effects of earthquakes, and that is, the occurrence of the shock at *all places at the same instant of time*. No matter if the shock be felt along the earth's surface a distance of four thousand miles in all directions, all places in a line directly north or south feel the shock at the same instant, as the records of its occurrence have always shown, whilst places to the east or west of the same line report the same instant of time, making the proper allowance for difference of longitude.

Now there is no power on earth known to man, that can possibly produce this instantaneous shock to all places within the circle of its influence, but electricity. Sane writers speak of the "earth-wave," and an "ocean-wave," produced by earthquakes. There are no continuous waves, other than the sudden shock or tremor, either upon land or water, except such as are purely local, caused by the direct upheaval and fracture of districts of country in the line of the greatest shock, and these produce the only rocking or waving motion to which the term wave, can be aptly applied.

Vessels at sea feel the shock, and all at the same moment of time though thousands of miles apart; there could be no "water-wave" that could do this; and further, vessels totally becalmed seem to feel the shock more severely than though they were at the time upon a rough sea, and yet not the slightest appearance of a wave is produced upon the calm sea; and in either case the shock is described invariably, as like one that might be expected had the vessel struck upon a rock, and in no wise like the effect produced by striking a heavy sea or wave.

A part of Lisbon bordering on tbe sea was sunk by an earthquake and never came to the surface again, whilst a still larger part was overwhelmed by a tremendous ocean wave that rolled in upon the doomed city. The waters first receded solely from the lifting up of the earth beneath, when on suddenly settling back to and even below its original position, the sea flowed in far beyond its former boundaries causing tbe destruction that is recorded of it; and this is the only kind of *wave* properly so-called, resulting from earthquakes.

We are now ready to assert our belief that earthquakes are caused solely by the instantaneous passage of immense accumulations of electricity from portions of the earth whicb are largely plus, to others which are minus, and in its passage traversing the best conductors presented; and tbese without doubt are the great metallic ore-veins of the earth. The first, immediate effect of its passage is the shock that is felt simultaneously on land and sea, throughout tbe entire extent of its influence. Its secondary and local effects are as varied as tbe diversified conditions of the earth along the route of its transit would be likely to cause. The former, can be well compared to the shock the physical frame of man or animal feels on receiving a powerful electric discharge from a battery; whilst the latter are of an entirely different character, and will be alluded to again, after we present an experiment or two so completely analogous to that of electricity traversing the earth's metallic veins, as to prove to our satisfaction, tbat in it lies the true cause of earthquakes.

We will take a clay pipe-stem the substance of which is a non-conductor; into one end run a bit of iron or copper wire half-way through, then turn the open end up and fill in one-fourth of an inch with powder mixed with a little iron filings, insert the other wire down to the powder, now lay it upon a table and

send even a light charge from an electrical battery through the wires, and the powder will be ignited and the tube burst into fragments. Now instead of powder take powdered rosin or sealing-wax, and the result is the same as before though attended with no apparent combustion of the rosin or wax; but a remarkable fact connected with this experiment is, that, instead of an explosive or inflammable substance we substitute one which is neither, such as dry earth, clay, sand or powdered glass, and the explosion seems equally violent.

Let us extend the experiment by placing upon a table, from one side to the other, several sections of wire or any good conductor and bringing the ends within a quarter of an inch of each other; now cover the spaces and the adjacent ends of the conductor with different earths having different degrees of compactness; covering some with weights, and in every respect varying their conditions as much as possible; now send a strong charge of electricity through the line formed of conducting and non-conducting substances, and the latter will be blown up, scattered, cracked, and the weights raised for an instant only to fall back to their original position, no two being affected alike but all of them earthquakes in miniature, and these without calling to our aid the powers of explosives or pent-up steam or gases, except such as may be the result of an instantaneous action of the electric fluid upon the substances it encounters in its passage; and these substances need not as we have shown, be either explosive or inflammable.

Now mining experience in California has shown us that metallic veins are not always continuous; but in many places broken or disjointed, and this feature doubtless pertains to all the great metallic ore-veins of the earth, and intervening, between the ends of these disrupted veins are substances that compared to the veins themselves are non-conductors. These breaks or chasms in the regular veins are doubtless sometimes of great extent, and the passage of the electric current through them causes the infinite variety of upheavals, rollings and rockings of the earth adjacent to and above them.

This doubtless is the real reason why one place of only limited extent, seems more violently agitated than another near by, though apparently in the direct route of the electric current. In one part the fluid traverses a nearly perfect conductor, and here the disturbance is but slight; but let it be compelled to leap the chasm that was made through and deep below the conducting vein, when the Golden Gate chasm was formed and we hear the rumblings of the earthquake and San Francisco feels the shock, and so of other places situated on or near any of these dislocations.

We intended to have shown what connection volcanoes have with earthquakes; but we have already greatly exceeded the limit usually allowed to writers, who are able only to interest the few.

Little Children.—Bless the little children! Who does not love to hear their sweet voices ring merrily and sweetly out under the clear and open sky? If there is reserved for human life a joy more exalted than any other, it is that of witnessing and mingling in the innocent enjoyments of children. So nobody has said, "beware of that man who does not love children." The noblest minds that the world has ever witnessed, have been delighted with the frolics and amusements of children. The great Duke of Wellington is often referred to as an example in this respect. It is recorded that when the veteran Blucher once looked upon a large collection of children, assembled at St. Paul's, in London, despite of his attempted forbearance, the big tear drops trickled down the cheeks of the hardy warrior until he was completely unmanned. The great Burke, whose mighty mind swayed senators at his will, was accustomed, in his hours of leisure, to take an active part in the amusements of children: lying down upon the carpet, rolling over and tumbling about with them like a very child himself.

Children are human flowers! When cares crush the spirit and labor wearies the body how refreshing the smiling looks, the bounding step and the joyous laugh of the little ones as they come rushing forth to meet you on your return from your field of labor, your counting-house or your office! Care and weariness are alike forgotten, while joy beams forth at the sight of these beautiful human flowers. Misfortunes, disappointments and treachery would sour the sympathies of the soul; while mildew would gather thick upon the face of man's existence were it not for these beautiful, infantile human flowers springing up everywhere in all the pathways of human life!

A child thus defines gossip: "It is when nobody don't know nothing, and somebody goes and tells of it."

There were enlisted during the war 186,057 colored troops.

From Our Regular Correspondent.

Editors Press: Though my observations in this county have not been so extensive or so thorough as I should have been glad to make them; still in my hasty trip I have collected some facts which I think will probably be of interest to the readers of the Press.

The gold quartz mines of this county, with the exception of those in the Volcano and Pine Grove districts, noticed last week, are situated principally on the "Carson lead," otherwise known as the great "Mother vein" of the State, which consists of a principal ledge, flanked by a series of subordinate, parallel ledges, running through the country in a northeasterly and southwesterly direction and occupying the line of contact between the ordinary slate formation of the country on the western, or foot-wall side, and a narrow belt of "greenstone," apparently volcanic, which forms the eastern or hanging wall. The subordinate veins are wholly in the slate, or greenstone, as they happen to lie to the eastward or westward of the principal lead.

The main Carson ledge varies in width from three to thirty feet, and in dip, (to the eastward, in all cases), from thirty-five to fifty degrees from the perpendicular.

The principal feature of this vein is the large size and steady character of the chimneys of paying ore, which, however, is generally of low grade—six to eight dollars per ton being considered a fair yield. The large size of the vein, and uniform character of the quartz, makes its extraction and working very easy and economical. The subordinate veins vary more in the character and richness of their ores, and are generally smaller, though in one case, that of the Keystone claim at Amador City, a ledge lying to the westward of the principal vein, is twenty feet in thickness.

I will notice by name some of the principal mines on this range, beginning with

THE SEATON MINE,

Better known as the "Drytown lead," situated on the "Mother vein," one and a half miles east of Drytown, this being the most northerly of the mines on this range that I visited. This mine is noted for having in the short period of twenty months from its first opening, paid over $100,000 in dividends; besides paying for the erection of a 40-stamp mill, and all its own expenses. It is owned by the Seaton Mining Company, one-half of the stock of which is held by Mr. Henning, the Superintendent, and most of the remainder by prominent San Francisco capitalists, a small portion being still held by the heirs of the late Hon. Geo. W. Seaton, the original proprietor of the mine. The width of the ledge, as far as opened, varies from nine to twenty feet—the paying portion being represented as averaging eight feet. The average yield of the quartz crushed during the past year, Mr. Henning assures me, is over $20 per ton; that average being much increased by a small layer of decomposed quartz of almost fabulous richness, which is found directly under the hanging wall of the vein, near the surface. The mine is opened by a tunnel for a distance of 400 feet along the vein, and at a depth of 183 feet from the surface at its northern extremity, at which point it is connected with the surface by a shaft. The mill of forty stamps, is run in winter by water-power, and in summer by steam; the power being furnished in the present season by a 40-foot overshot wheel, and in summer by an 80-horse engine of fine substantial workmanship.

Adjoining the claim of the Seaton Company is that of

THE LOYAL MILL COMPANY,

Consisting of 1,200 feet of the "Carson ledge." This company commenced work in September last on an extensive outcrop of mingled quartz and slate of varying richness, and over 100 feet in width. A stratum two feet thick, lying next to the east, or hanging wall, proved to be very rich, paying $75 to $100 per ton. On following this down a considerable distance, it entirely disappeared, and the miners came upon a horizontal surface of hard greenstone, like that forming the hanging wall of the vein. As the dip of this stratum was to the westward, instead of the east, as it usually is in this vein, the superintendent, Mr. James, came to the conclusion that the upper part of the vein had slidden down the hill on the surface of the greestone, and that the remainder of the vein would be found in its original position farther to the eastward. For the purpose of testing this theory, and prospecting the mine, he took possession of an old abandoned tunnel, which had been driven into the hill on the western side, for a distance of over three hundred feet, but which had been given up by the original projectors, on the slate in which it had being run changing into a hard greenstone. This tunnel he has pushed on to a distance of 350 feet. It will cut the ledge at a depth of 200 feet. They will probably have to drive this tunnel a distance of twelve feet further before striking the ledge, if it should be in the most natural and probable position at this depth. A shaft is being sunk for the purpose of connecting the end of the tunnel with the surface. It has reached a depth of eighty feet.

The company have a very fine 20-stamp steam mill, which, however, is now idle for want of quartz to supply it. Next southwest of the Loyal, is

THE HAZARD CLAIM,

Owned by Messrs. Flochart, Sugden, and others, of Amador. The vein is here only from four to five feet in thickness, as far as explored, which, however, is not to any great extent. The proprietors have an 8-stamp water mill. Mr. Sugden, who has charge of the mine and mill, assures me that the average yield of the quartz is from $10 to $12 per ton.

THE BUNKER HILL COMPANY

Are working a claim lying about a mile from the Hazard, on the same vein, which is here about three feet wide. It has been explored to a depth of 300 feet, and the rock taken out varies, according to the estimate of the superintendent, Mr. Palmer, from $26 to $50 per ton, averaging from $10 to $12. The mill is about half a mile from the mine, and consists of eight stamps, and sixteen of Knox's amalgamators, driven by water-power in winter and steam in summer. Mr. Palmer says the pans give excellent satisfaction.

The next claim upon which active operations are carried on is

THE SPRING HILL,

Situated at Amador City, and owned by Messrs. Hooper & Sons. This mine has been opened to a depth of 200 feet, and for a distance of 1,300 feet along the ledge, disclosing a fine well defined ledge of quartz, fifteen feet in thickness. I did not learn what proportion of this was considered "pay rock," but was told by Mr. Hooper that the crushings had yielded from $8 to $12 per ton. This mine has been worked for a long series of years, and is well and thoroughly opened. Both ore and water are hoisted in buckets by steam-power; not a single pump being in use in a gold mine in Amador county. The mill consists of thirty-one stamps and four of Knox's pans, for working sulphurets, the whole being driven by water-power in winter and steam in summer—the former being obtained from an overshot wheel of thirty-seven feet diameter, and the latter from a 60-horse power vertical engine of the walking-beam pattern.

Adjoining the Spring Hill on the south, is the claim of the

KEYSTONE CONSOLIDATED MINING COMPANY,

Mr. John a Faull, superintendent. The property consists of the Keystone and Geneva ledges, and the Keystone mill, the Geneva being an extension of the Spring Hill. The Keystone is a parallel ledge lying to the westward of the Carson lead, at a distance of about 100 feet, and being, therefore, entirely in a slate formation. The greatest depth to which it has been opened is 584 feet, the present working shaft being only 206 feet. The ore and water are now hoisted by horses, but it is intended soon to substitute steam, an engine having been used on the deepest shaft before it was closed for repairs. The vein varies in thickness from three to twenty feet, having an average of at least twelve feet. Mr. Faull estimates the average yield at $17 per ton up to this time. The company have a 20-stamp steam mill, to which they are adding five of Prater's Concentrators. These are being erected by Mr. Morgan Hungerford, of San Francisco, who was in Amador at the time of my visit. The mine and mill were formerly the property of Mr. A. H. Rose, at present State Senator from Amador county, from whom they were purchased by the present owners, who, I think, have made an excellent investment.

The mines now recognized as the most valuable of any on this range, are situated at the village of Sutter, two miles southwest of Amador, and four miles from this place. The principal of them is

THE EUREKA,

Or Hayward mine, owned by Messrs. Hayward & Chamberlain, famous as the deepest gold mine in the world, and the deepest mine of any character in California, if not in the United States, being worked to a depth of over 960 feet. This mine is situated on the main Carson lode, and is the richest location ever made upon it. The owners have two mills with an aggregate of fifty-six stamps, and usually clean up at the end of a two week's run about $20,000. The ore is transported from the hoisting works to the principal mill, on a railroad made of light T rails, laid on cross-ties, after the manner of an ordinary railroad. It is by far the most substantial and durable mining railroad in the State.

A late discovery in Sutter is known as

THE RAILROAD MINE,

Owned by Messrs. Belding, Downs and others of Sutter. The ledge is in a slate formation, and has been opened to a depth of 200 feet, and by drifts laterally a distance of 180 feet, disclosing a vein of stratified quartz of an average width of eighteen inches, showing much free gold, and which appears to improve as it goes down. The last crushing paid fifteen dollars per ton. At the time of my visit they were employed hoisting water by horse power, as the mine had been flooded by the late rains. The Lincoln and Mahoney are among the oldest and best paying mines in the State.

Sutter is regarded, and I think justly so, too, as the great center of quartz in Amador county, and the long experience and careful observation of those engaged in the business, has given them the reputation of an authority among their neighbors on all questions connected with quartz mining. One gentleman, the superintendent of one of the oldest mines in the place, assured me, very seriously, that he thought that, considering his long and varied experience, there was nothing left for him to learn in regard to "practical mining," though there might be something in regard to "prospecting" that he did not know. I took the liberty of inviting this gentleman to become a contributor to the Press, which invitation he very graciously accepted, and the readers of the Press may hope at no distant day to have laid before them an array of facts in regard to the practical working of quartz, which will be of incalculable value to the mining interests of the State.

Between Sutter and Jackson are several mines on the same range, the principal of which is

THE ONEIDA,

At present owned by Messrs. Morgan, Dickerson & Co., and superintended by a Mr. Pringle. This mine has been worked since 1851. Two shafts have been sunk to the respective depths of 350 and 400 feet, and steam hoisting works erected on both. Both are now, however, closed for repairs, and a new shaft has been sunk, some distance to the northward, to a depth of 110 feet, from which rock is hoisted at present by horse power. In the old shafts the vein was from six to fourteen feet thick, but in the new shaft a drift has been run for a distance of thirty feet from the shaft, in the direction of the foot wall, without striking it. The mill is driven by steam, and consisted at the time of its purchase, of twenty stamps, to which the present proprietors have added as many more, and an Excelsior Grinder and Amalgamator, for working the sulphurets which are believed to be very rich. It was expected to start the works in a few days after the date of my visit.

The principal mine at Jackson is

THE CONEY,

Owned by Mr. Leonard Coney, of Jackson, and Biglow Bros., of San Francisco. It has been opened to a depth of about seventy-five feet, though the lowest working level is only about sixty. The vein is from four to twenty-seven feet in thickness, and the rock thus far has averaged eight dollars per ton. It is believed to be upon the same vein as the principal mines of Sutter and Amador. The proprietors have erected a substantial steam mill of eight stamps, with two of Prater's concentrators, and the same number of Knox's pans. Both machines give good satisfaction.

Adjoining the Coney, on the northeast, is

THE BLUE JACKET CLAIM,

Consisting of 800 feet of the same ledge, owned by Messrs. Little, Dunning & Burwell. It has been prospected by means of an open cut, and is found to be over twenty-two feet wide, the cut being of that width, in quartz all the way, and no signs of the walls yet. The quartz is somewhat decomposed, and is readily taken out. It has yielded thus far an average of five dollars to the ton, by a barbarous method of crushing, adopted in the only custom mill in the place. This is

THE KEARSING MILL,

Of four stamps and a grinder, driven by water power. The whole machinery is very imperfect, but as it is the only custom mill in town, it has all the work it can do.

West of the Coney and Blue Jacket, and on a parallel ledge, is the famous

HINCKLEY CLAIM,

Owned by Mr. T. Hinckley, of Jackson. This ledge has only been opened to a depth of seventy feet, but it has yielded over $13,000, of which 10,000 has been clear profit, the quartz paying on an average forty-five dollars per ton. At a distance of 127 feet from the main shaft another hole has been sunk, from which very rich quartz has been taken, proving that the chimney extends that distance, if not further.

Besides these, several minor claims are being prospected in this vicinity, all of which show more or less gold, so that we may soon expect to see this place take rank among the most important quartz mining towns in the State.

REPORT

ON THE

Mining District of BATOPILAS, in the State of CHIHUAHUA, MEXICO.

[Extracts from a work now in Press in the Mining and Scientific Press Job Printing Office.]

(Continued from Page 117.)

SOME TECHNICAL EXPRESSIONS USED IN THIS DISTRICT.

BODOQUE—A sort of rotten veinstone, in which the native silver is found disseminated, either in very fine particles, or lumps and nails, or other fantastic shapes of larger or smaller size.
BODOQUE BLANCO—White chlorides of silver.
TIERRA ABODOCADA—Chlorides of silver.
PETANQUE—Black sulphides of silver in metallic form.
PASTA—A class of arsenical silver ore in metallic state.
GUIJA PIZARRA—Quartz (flint).
GUIJA MOLLAR—Rotten quartz.
ESPATO CALIZO—Calspar, (the principal matrix of the lodes.)
COPALILLO—A yellowish blende.
PLOMOSA—Lead pyrites, galena.
FIERROS—Arsenical pyrites.
BORRASCA—An earthy, generally soft part of the vein, which, in some particular veins, is harren, in otbers, extremely rich.
BORRA—Barren part of the lode.
OJO DE PLATA—Deposit of silver in the lode.
CLAVO DE PLATA—Chimney of silver in the lode.
ROSICLER—Ruby, or dark silver ore.
CARDENILLO.—Light red silver ore.
BOLA DE PLATA—Roundish shaped masses of native silver.
TEJOS DE PLATA—Pieces of native silver, generally found embedded in the borrasca.
TEPETATE—Rubbish stones.
GAMBUCINOS—Poor miners who hunt metal on their own account.

THE EXTENT—"PERTENENCIA,"

Of a Mexican mining claim is 800 varas (2,400 feet) in a longitudinal direction, measured on the lode, and 100 varas (300 feet) in width, counted on either side of the lode, according to option.

TRANSPORT ROAD FROM THE SEA COAST TO BATOPILAS.

The present regular monthly steam communication between San Francisco and the northwestern coast of Mexico, offering great facilities for communication with, and sending goods from and to the interior of that country, cannot fail to influence immensely the rapid development of those vast yet partly unknown mineral regions, from which, within a few years, an extraordinary stream of wealth must naturally emanate.

Batopilas, although lying in the centre of the high Sierra Madre, will still be destined, at some future day, to pour forth a not inconsiderable part of those treasures; and the question whether it may be reached within three or five days' travel from the nearest sea-port town will be of very little importance, inasmuch as those natural roads, already existing, are in a state quite sufficiently good for transportation.

Two starting points offer themselves from the coast, nearly equal in their advantages: First, the port of Mazatlan; second, the port of Guaymas.

Shipping goods, or mining materials, out by the way of the first, are re-embarked on board small coasting vessels to the ports of Navachiste, Babarrasa, or Playa Colorado, in the State of Sinaloa. The freight to either of these places is nine or ten dollars per ton of 2,000 lbs. From thence the packages—none of which must weigh more than 300 pounds, but better still of 150 pounds each—are transported over a good natural wagon road, through a level country, to the town of El Fuerte, distant about twenty-eight leagues, at a cost per carga of 300 pounds, of three to three and one-half dollars.

From El Fuerte, a sufficiently passable road for pack mules leads over the mountains to Batopilas, on which the general cost per carga amounts to from seven to eight dollars, the distance being probably seventy odd leagues, in a straight line.

The total expenses of transportation of goods from Mazatlan to Batopilas will, therefore, average eighty to eighty-five dollars per ton, in which the fees for commission, etc., are included.

The cost of shipping from San Francisco to Mazatlan, on board a sailing vessel, which generally runs down in from nine to twelve days' time, varies from seven to nine dollars per ton.

From Guaymas, schooners are running to the small ports of Ajiavampo and Santa Barbara, in the State of Sonora, charging freight at the rate of nine to ten dollars per ton. From there a good wagon road leads to the town of Alamos, distant about twenty-five leagues, to which place the general charge is from three to four dollars per carga, or about twenty-five dollars per ton.

From Alamos to Batopilas, over the same mountain road as the former, the distance is seventy-five leagues in a straight easterly direction, and the freight ebarge per carga is eight to ten dollars, or about sixty dollars per ton.

Batopilas is situated in about 27° 30′ North Latitude, and 107° 26′ West Longitude from Greenwich; distant from the Capital of the State of Chihuahua about 130 leagues in a northeast direction, from the town of Parral eighty leagues, and the same from the mining district of Refugio, to the South.

I will now, gentlemen, give you an outline history and description of some of the principal old "Bonanza" mines of the district, as well as such as have been worked in later days, referring you about their relative location to the accompanying map.

For many of the followiug notices I am indebted to the kindness of Mr. George Le Brun, Director of the mint in Alamos, an English gentleman, not only of the most honorable character, but also of such high scientific attainments that his name is looked upon as a *safe voucher*, not only over all Mexico, but also favorably known in Europe, who used to work, and actually still is doing so, various mines in Batopilas. Also to the communication on the subject hy Don Francisco Viniegra, a prominent resident of the district, and several others, and the very excellent and scientific notices of the district of the eminent German geologist and miner, Mr. A. F. Schleiden, which I had occasion to examine.

First of all ranks, undoubtedly, the great

"PASTRANA" MINE.

The lode runs in a spur from the "Cerro de Animas," with a general direction from southwest to northeast, with the medium dip of twelve degrees East.

From the very scanty remaining documents, we can only draw the information that this mine was first worked toward the end of the seventeenth century, and gave its first great "bonanza" of many millions of dollars in the early years of the last. This lasted without interruption for eighteen years, most of the time in the very richest metal, so that frequently over $40,000 in one week were realized.

We do not know the reason why it was finally given up, although there is a common saying among the mining population, that in a very rainy season, during a tremendous shower the water entered and filled the lower works so rapidly that the workmen employed in them then had not time to escape, and were drowned, leaving many of the pillars and galleries in rich metal. One of the pillars taken out in later years from the upper works, gave $40,000 in silver.

Certain it is that since then this water has not been cleaned out, although several parties afterwards undertook to do so, but failed for want of means. The depth of the mine is reported to be about 150 varas, of which about 70 remain inundated.

Between 1770 and 1780, one Ordoñez, and after him, others, extracted considerable riches from other parts of the vein, among which an enormous quantity of the very richest chlorides of milk-white lamas, which, for a long time, out of ignorance, was thrown away, yielded them a principal part.

Before these parties, however, another "bonanza" was taken out hy a Spaniard by the name of Serastegui, in a part of the lode known as the "Obra de Serastegui."

At the beginning of this century, one Blas Alvarez repaired another old shaft, and dedicated himself for several years merely to the extraction of the silver remaining in some of the former pillars.

The last capitalist who worked there, was Don Juan Nepomuceno Sanchez, who was then the administrador of the rich Marquis of Bustamante, and acknowledged to have been a miner of rare scientific attainments. He intended to take the water out of the old mine hy way of a deep shaft, and a windlass driven by mule power, some remnants of which are still visible. The expulsion of the Spaniards in 1821 put an end to this laudable enterprise. With this, almost every kind of work in Batopilas came to an end.

In 1859, Mr. George Le-Brun took hold of the mine, and began driving a tunnel from the southeast, with the view of striking the vein below the reported ancient works and draining them. With untiring perseverance he has continued this work up to the present day, having now accomplished about 240 varas in length, without, as yet, attaining the object.

Should a part of the old, vague reports prove true, as to the works being left in metal, another great "bonanza" will undoubtedly reward his well directed exertions.

The same gentleman, a few years ago, while engaged in the foregoing, entered another part of the mine, called "Tiro de Sanchez," and struck a thread which, in a very short distance, gave him about $46 000, although the said thread was no thicker than from a half an inch to three inches. This is a proof of the extreme richness of the "Pastrana" metal. There seem to enter quite a number of such threads, all of which contain more or less, and will pay for the working.

Mr. Le-Brun is actually again engaged working another thread in the same mine, and if the metal should run on only for some ten varas as that extracted for the past two weeks, it may also give him another handsome fortune.

Now, what riches must the main lode give, which is known, and visible in several places, to be six varas wide, and reported eight varas at the bottom of the old works? Its average width in the still accessible parts is from one to one and a half varas.

The owner of this celebrated mine is just now negotiating its sale in the City of Mexico and Paris, with a flattering prospect of realizing a large sum for it. I am given to understand that he asks for about one half of the shares $300,000.

Adjoining this, and, in fact, laying on the same vein, to the north, we come to the

LA "CATA,"

Also owned by Mr. George Le-Brun. In this mine laying in the same favorable mineral ground, the lode divides itself into three chambers of an average thickness of three-fourths of a vara, which seem to be extremely rich in sulphurets. Evidently, it has also been worked a great many years back; and, in one of the chambers, at least, some 70 varas in depth. The still accessible works extend also over a considerable length. It is not known who were the original workers, but it is evident from the nature of the former that they must have taken out from them great amounts of silver.

Don Nepomuceno Sanchez worked the mine for several years for account of the Marquis of Bustamante, and extracted a considerable bonanza, part of the time in solid silver, as several of the old men, still living, who worked under him, assert that it was, in places, four inches in thickness. After him, a Mexican gentleman, by the name of Don Marcos Viniegra, worked it for a time, and also got very rich returns. The accidental destruction of a viaduct which ran along one of the upper openings, allowed the water to rush in freely, filling up a great part of the mine, and finally obliging him to quit it. He left there, in paying metal, several of the lower levels towards the south, and on the eastern branch of the vein.

Mr. Le-Brun, in 1860, took the water out of the middle branch works, and found in parts some very rich ore. He also intended to drain the former; but happening at the time to lose a large capital by the failure of a house, he was compelled to desist.

A few weeks ago, he again put a few workmen into a part of the western branch, where he intends making a cross-cut to a promising by-vein, and got into very fair prospects. Also, in another place above, in the centre branch, the latter are becoming excellent, and should the metal continue in downward tendency, there is a good hope that rich returns will reward his perseverance.

The circumstance of the hill to the north being as yet perfectly virgin, and throughout of superior mineral appearance, gives great weight to the "Cata" claim to rank among the very first mines in Batopilas.

To the west of this, about 200 yards distant, is found the now celebrated mine

"ARBITRIOS."

This mine, since the last two years, became the property of an American Company, incorporated in San Francisco. In its days of glory, it undoubtedly formed one of the galaxy of others which, by their bonanza, gave their owners extraordinary riches.

It must, to all appearances, have been abandoned for upwards of a hundred years. Not a single document exists at present relating to its former returns. A just conclusion as to the enormous masses of silver that came out of this mine may be drawn from the contemplation of some of its still accessible upper works, in places hollowed entirely to the height of fifty or sixty feet. Old reports still floating in the district corroborate the statement that the "Arbitrios" gave great masses of perfectly solid silver; and Don Juan de Escudero, in his work, says: that he heard from old men that it gave only a little less than the "Pastrana," which, in its first bonanza, was computed at nearly twenty millions.

The reason of its abandonment is of course lost to us. Very likely the same cause that acted on the "Pastrana" may have done so here. It is well known that a mine with large openings once left, although but for a very short time, will rapidly fill up with rain water, which naturally drains towards the lower works, filling these and preventing its rehabilitation.

The mine is reported to be about 100 varas deep, of which some 50 are filled up with rain water and rubbish.

A so-called "sacobon" (tunnel) was commenced in 1820 by Don Juan Nepomuceno Sanchez, who had the greatest faith in the mine, in order to facilitate its draining and cleaning. His object was prevented by the expulsion of the Spaniards. Had he succeeded in his enterprise, he could only have gone about midway of the bottom, whereupon shafts would have been indispensable.

The pillars of the upper works having mostly all been thrown down by the gambusinos, on account of their great richness, caused these works to fall in, thereby closing and destroying them; yet, it is supposed that the lower works will, in parts at least, be found open, and some of the remaining pillars in paying metal.

The company at present working it, intend to take the rainwater out by means of force-pumps, and, when down to the bottom, sink through the intervening barren section of the lode, where they are confident of striking again into the same deposit of silver which formerly made the "Arbitrios" so famed. The works are so far advanced, that the company entertain the well justified hope of soon being compensated for their exertions.

"THE RONCESVALLES."

located on the same vein as the former, towards the S. W. It shares an equal fate with it, in regard to the scantiness of documents relating to the state of its works and amount of silver produced. A lawsuit was commenced in 1727 by one of its owners, relative to the extraction of water from an adjoining claim, which stopped, for the time being, all work on it. It is reputed to have been for a number of years in Bonanza, during a part of which (nine months) it yielded over 3,000,000 of dollars. It is said to be one hundred varas deep, but is now entirely filled up with water.

The present owner had of late began to clean an old work of its rubbish, and found some very fine silver left in it; but want of greater means on hand prevented him from prosecuting it.

The location and mineral ground in which the lode runs, gives great hope of another "big strike;" but the drainage, by means of a tunnel, must be undertaken, and such could be done easily.

LA "NEVADA."

The traditions of the district say that the first foundation to it was laid about 200 years ago, by the accidental discovery, by an Indian swimming the river during a very high freshet, of a vein shining in beautiful white silver, as bright as snow, and caused the name *La "Nevada"* to be given it.

The place where it was found, was right on the eastern bank of the river; the sides of the lode, by some natural accident laid bare, were thickly covered with the glittering metal, and being followed up, soon entered into solid silver, until the water penetrated into the fissures of the vein, where it dipped under the bed of the river, and prevented the workmen from going any further downward, at that time not being provided with any of our modern appliances.

So, common report says, this place was actually left in silver, after giving a considerable bonanza. At our present day, it is only marked by a large piece of rock, jutting into the water, while the space intervening between the margin of the water and the mountain, rising up a few yards behind, is entirely filled up by sand—in fact, so obliterated, that nobody passing it would entertain the slightest idea of its ancient fame.

Numerous other rich lodes shortly after being discovered, it seems that the "Nevada" was then left; at least, there exist no documents proving the contrary; and by careful inspection I have not been able to discover any other works on it, except a small shaft, partly filled up, about 30 varas above the river. Yet there is no doubt it will, in all probability, contain riches as great as any of its far famed neighbors, the "San Antonio," the "Carmen" and "Cancio," that had the fortune to be extensively worked, and consequently paid many millions into the laps of their owners.

Its Location is on a hill, adjoining the one of the great "San Antonio Mine," only separated from it by an intervening ravine.

The Mineral Ground (panino), through which it runs, belongs, for a considerable distance, to the first order, slightly differing from that, and holding, in its precise nature, the middle between this and that of the "San Nestor" lode, lying on the same hill to the south.

The Rock forming it consists of syanitic porphyry, higher up blending with granite and diorite.

Its general course lays S. to N., 20° E., with a dip of 20° W. The distance from the town is about one mile in a N. E. direction, easily reached by a plain road along the river.

The lode shows itself well defined, of about one vara width on the surface. Numerous by-veins and threads *(Cintas e hilos)* cross or fall into it on various points; among the first, one called La "Purisima," at about 180 varas from the river, which has only a work of about eight varas depth in it, giving therefrom a rich pocket of silver.

Taking its, as yet, almost virgin strata, its location between the "San Antonio" and "San Nestor" mines, and other favorable points, into consideration, I am of the opinion that the *"Nevada,"* if once properly opened and prospected, will turn out great riches.

LA "CANDELARIA"

Lays next adjoining the former one, and bears in general the same character, which to mention would only be to repeat the same. Its course likewise is from S. to N., 15° W.

This vein was discovered about fifteen years ago, by a man named Nepomuceno Avila, who on a particular spot, about 200 varas above the river, took out about $12,000 in some twelve varas depth, in exceedingly rich bodoques *(chlorides)* and earth. Some sixty varas below this place, is a small work, consisting of two shafts of about ten varas depth, given by "Gambusinos."

The lode here shows itself divided into a number of small threads, all of which contain metal, and have been extensively bored into by those shrewd workmen. They tend to unite again to form a body some thirty varas below. Some five years ago, one Don Antonio Aguirre sank a few varas here, and drove a short gallery of three varas to the S. W., towards a cross vein, out of which he took about $3,000.

An English gentleman of this place, Mr. Wm. Hooper, of great enterprise and scientific attainments, undertook, four years ago, to drive a gallery or tunnel on the lode, about fifty yards lower down, but was prevented from executing his purpose by temporary want of means. Right at the entrance of the before mentioned small work, the "Candelaria" is likewise crossed by the La "Purisima" vein.

In the upper parts of the claim, enters another independent lode, which shows a very formal body of about one yard width, and is very fair looking, while the "Candelaria," at the work of Avila, and below where Mr. Hooper worked, attained the same average width near the surface.

The mine offers the same inducements for a regular work on it, and equal hopes with the "Nevada" of very rich returns.

THE "SAN ANTONIO."

This celebrated mine, generally looked upon as the second leading one in the District, lays about 300 varas to the N. E. of the "Candelaria," on the hill of its own name, and the east side of the river.

It is the property of an American company, represented by Mr. John Robinson, a gentleman of high respectability and valuable practical experience. Its general direction is from S. W. to N. E., with a dip to the W. of 20°.

The Rock forming the hill seems mostly to be a fine grained diorite, changing in the ravine, in places, into aphanite and granite.

Its first discovery was made about the beginning of the present century, by a poor laboring man by the name of Cristobal Perez. It is said that the native silver commenced from the very surface, and continued without interruption for the term of fourteen years, to a depth of 120 varas, by an average longitudinal extension of fifty varas.

In the still accessible parts, the metal appears to have been richest where stratified rock joined the diorite, here perfectly compact, and without crystals; while towards the north this offers all the characteristics of a conglomerate, that seems to have given much less. The amount taken out is reported to have been above *sixteen millions of dollars*, which were, however, spent by the old man and his two prodigal sons, one of which is still living, although poor, in a neighboring village.

The vein, averaging three-fourths of a vara in width, extended itself in places to fifteen feet, which were filled with the rich metal.

Since its abandonment the mine has filled up with rainwater and rubbish from the pillars, which were thrown down by the *Gambusinos* in some of the lower levels.

Mr. Robinson is now engaged in driving a tunnel, called the "San Miguel," which will eventually strike the lode below its old works, some of which, especially one towards the south called the "Santa Ana," is known to have been left in good metal. Another tunnel is being run for the same purpose, starting from the ravine.

LA "DOLORES"

Lays to the west of Batopilas, at the head of a small branch of the ravine called after it.

Its direction is southwest to northeast, with a dip of 22° West, and located throughout in first-class mineral ground. Of all the old bonanza mines in this district, this enjoys, probably, one of the first names in regard to the richness of its antlepile (terrero), which in itself proves the former richness of its metals.

Mining Summary.

CALIFORNIA.

NEVADA COUNTY.—The Nevada *Gazette* says that a lot of one hundred and ten tons of rock from the Tolbert ledge, crushed at the Oriental mill, was cleaned up on Saturday, of last week, and yielded between eleven and twelve hundred ounces of amalgam. We do not know how much the amalgam retorted, but even at four or five dollars an ounce, the yield would be large. The ledge is being worked steadily, and we understand that the owners purpose erecting steam hoisting and pumping works immediately.

The Grass Valley *Union* says that Frank Morse, who has long owned an interest in the Essex Ledge, on Mill street, has succeeded in buying out the conflicting titles to the claim, and now owns some two thousand feet; he intends erecting machinery upon it during the next month.

The Nevada *Transcript* says that a considerable amount of prospecting is being done about Rough and Ready, and no doubt rich ledges will yet be opened. The gold found in the channels in that vicinity is all wash gold and bears unmistakable evidence of having come from quartz ledges. These ledges will yet be found, and those who search diligently are bound in good time to be rewarded. The editor has seen some specimens from the Sherman ledge, which is located about three miles from Rough and Ready. The rock contains a large amount of free gold and rich sulphurets.

The Excelsior Mines.—It is stated that the snow is gradually disappearing from the hills in Excelsior. Several claims on Old Mau Mountain are being worked. The California mill is crushing ore from the mines of the company. The Eclipse mill will shortly start up. Many persons who left last fall are returning to the mines. The people are anticipating lively times in the spring.

Two hundred pounds of rock taken at random from the White Mountain lead, worked at the Mariposa mill in Virginia city, yielded $36 per ton. This rock was not selected, but was taken from across the width of the lead. Parties have offered to erect a 20-stamp mill for half the mine. Whether the owners will accept the offer remains to be seen. The lode is seventy five feet wide and well defined, and can be traced southerly three miles.

The Fredonia mine, situated in Meadow Lake district, has been sold recently to a New York company. The amount paid for the property was $20,000. The Fredonia is regarded as among the leading mines of the district, though not so well developed as a number of others.

PLACER.—A gentleman who has had much experience in hydraulic mining about Dutch Flat, expresses the opinion that good hydraulic claims can be found in the vicinity of Auburn, and is now on a visit there for the purpose of finding suitable ground upon which to commence work. The editor of the *Stars and Stripes* hopes his surmises may be correct and the undertaking a successful one.

The same paper adds that almost the entire section between Auburn and Grass Valley is a mineral region, traversed by numerous ledges, the golden richness of which will some day astonish many an "honest miner." Not many years hence we expect to see numerous quartz mills erected upon some of these ledges. Capital and more practical quartz miners is what we need in this section.

AMADOR.—The editor of the *True Press* has been presented with a beautiful specimen of gold-bearing quartz, by Ruffino Barni, agent for Jose del Carmen Rodriguez, owner of the celebrated "Cerro Rico" vein in this county. The specimen literally sparkles all over with gold and is the richest we have ever seen. The vein is situated on Bear Creek, about two miles from the town of Colorado, and eight miles from Mariposa. The editor thinks it is a fortune to its lucky possessor.

MONTEREY.—The Monterey *Gazette* says: We are repeatedly asked whether we bear anything more of the silver mines that were reported discovered some time since. We are not in receipt of anything definite yet. All that is known is that mines have been found, and there are parties now engaged in thoroughly prospecting them. Nothing definite has been developed as yet, but holders are very sanguine. We will wait and see, and we are assured by a gentleman largely interested and in every way reliable that should the result be that anticipated, *i. e.*, favorable, that he will lose no time in apprising us of the fact.

ALPINE.—We learn from the Silver Mountain *Bulletin* that the Mullan company, at Mogul, have struck some very rich rock in their claim, forty-seven sacks of which have been shipped to the Pioneer mill at Markleeville, to be worked.

We learn from the Monitor *Gazette* that the company owning the Lady Franklin, or Fremont lode, in Scandinavian Cañon, have got their ledge, and that it is all the most hopeful stockholder could wish. They have a mass of clay which proves to be rich in chloride of silver, and intermixed with fine looking quartz, showing ruby silver in remunerative quantities. They had previously passed through this, and thought it worthless. This occurrence shows the necessity of watching closely for new developments in our mines as the work of exploration proceeds—and the importance of having superintendents thoroughly versed in and educated to their business.

The workmen in the Morning Star tunnel struck through into their shaft a few days since, thus insuring good ventilation in the future progress of their work, and relieving the Company from the necessity and expense of artificial ventilation.

Quartz of a very rich character has recently been taken from nearly all tunnels that have tapped their lodes. The Wide West shows equally as good a ledge as the I X L or Buckeye No. 1, and has commenced a double shaft, well and securely timbered, which is now down fifty feet. The ore that has already been taken from the ledge is such as fully justifies the erection of steam hoisting works, which would greatly reduce the cost of working the mine.

VIRGINIA CITY AND VICINITY.

The gold Hill *News* has prepared a tabular statement of the number of men employed in the mines at Gold Hill and Virginia City, together with the quantity of ore mined daily. We give the statement as a matter of interest to many who would doubtless like to preserve statistics of this kind:

VIRGINIA MINES.

	No. men employed.	No. tons ore per day.
Ophir	45	30
California	6	10
Gould & Curry	245	215
Savage	176	90
Hale & Norcross	40	40
Chollar-Potosi	160	90
Total	662	475

GOLD HILL MINES.

	No. men employed.	No. tons ore per day.
Bullion	28	
Exchequer	10	
Alpha	50	75
Imperial	75	150
Bacon	30	75
Empire	49	65
Eclipse	27	40
Stevenson	27	20
Consolidated	38	100
Floda	16	60
Challenge	48	50
Confidence	41	55
Burk & Hamilton	9	10
Yellow Jacket	180	175
Kentucky	11	10
Crown Point	75	75
Total	724	960

Supposing this ore to be worth $30 per ton, the amount taken from the Gold Hill mines, daily, would amount to $28,000; per month, $864,000.

The amount taken from the mines of Virginia, per day, would be, by the same estimate, $14,250; per month, $427,500.

The total amount of ore taken out in Virginia and Gold Hill, per day, is 1,435 tons; per month, 43,050 tons. Value per day, $43,050; per month, $1,291,500.

In the above estimate no account is taken of any of the mines outside of the two cities of Gold Hill and Virginia. A large amount of prepatory work is now being done, by which, according to the *News*, the present yield will be very materially increased within three or four months. The *News* thinks that in view of these facts and the late important developments on the Comstock lode, that district is on the verge of a new era in a mining point of view.

The Virginia *Union* says that since the several rich strikes which have recently been made on the Comstock lode, work upon many claims which had been partially or entirely suspended, has now been resumed, and several parties who were formerly owners in the old locations made years ago, north of these recent reported developments, are looking up their old stock, which by force of circumstances had become "wild-cat" and considered worthless. Among these old companies we notice that the Indisputable Quartz Mining Company, whose claim was located in 1863, and incorporated in January, 1864, have commenced work on their claim by sinking a shaft east of E street and north of Taylor. Some fair-looking rock, showing free gold, has already been found at a depth of ten feet, where their ledge was struck. Considerable excitement is now brewing on account of this and other locations on this same line, which are being looked up by the former owners. As the old owners of these long-thrown-up claims are now becoming wide awake upon the subject, we shall expect soon to chronicle the successful opening of numerous valuable quartz veins within a stone's throw of our office.

Nine bars of bullion, worth $7,820 60, were brought into Virginia City on the 16th ultimo, from the Whitlatch claim, Reese River.

A new mill is being built in Mountain Wells District, some three miles from La Plata, by a company known as the Connecticut & Nevada. The main mill building will be forty-two by eighty-four feet, and will go into operation about the first of April. The company own a lead some ten feet in width, which will average $100 per ton, by mill process, as the rock assays from $190 to $300.

Some ore lately brought to Virginia City from the new Truckee District assays $138 per ton. The argentiferous galena ores of this district are very rich, and we hope that some profitable mode of working them will shortly be discovered.

The Winton Mill, Excelsior District, Nevada county, California, is running on ore from the Pacific mine. It yields about $70 per ton.

The Hale & Norcross shipped $16,000 in bullion on the 24th ult. The California Company are taking out a considerable amount of excellent ore from near the surface of their claim. In following the deposits down, bodies of ore may be found which have heretofore been missed by the drifts of the lower levels.

The Globe Mining Company, on American Flat struck another vein of water in their tunnel on the 20th ult. They supposed they must have cut through the casing into the vein. A stratum of water five inches deep, running the whole width of the tunnel was running out at the date of the latest report. The water alone, if it continues is worth a fortune.

Work has recently been again commenced on the old Indisputable claim. This claim was located in 1863. The Company are taking out ore for a mill test. The lode is said to be nearly fifty feet wide at a point where it is cut by the Best & Belcher tunnel. Parties owning in old claims located in the range of the late developments are beginning to prick up their ears and look after ancient stakes and landmarks.

The *Enterprise* has seen some excellent ore from the New Truckee district, which was taken to that office by Mr. P. Williams. In the series are included the Moonlight, 4½ feet wide; the Northern Light, 7½ feet; and the Morning Light, 12 feet in width. The ores from these leads assay from $138 to $600 in gold and silver. Mr. W. exhibited a specimen of argentiferous galena which assays at the rate of $80 per ton in gold. So large a per cent. of gold has seldom been found in argentiferous galena.

REESE RIVER.

Location of Reese River Mining Districts. Much attention appears to be directed, at the present time, to the outside districts, which recognize Austin as their commercial center. Throughout the entire of Central Nevada, a number of new mining districts have recently been established, which promise, in the course of time, to prove equal to most of the older localities, the permanency and richness of whose mines is well established. South of Austin there are several districts in the Toiyaba range. On the west side is Washington district; into which capital is now finding its way, but from which no bullion has yet been received. Directly opposite, on the east side of the mountains is Blue Spring district. It is claimed that there are quite a number of very important ledges already discovered in this district. A large Pennsylvania Company is located here. Immediately south and adjoining is the North Twin River district; and still further south is the well known Twin River district itself, where is located the famous Murphy mine. A large amount of Eastern capital has already been located here. Still south of here is the South Twin district, where it is said no less than four mills are to be erected the coming summer. From Blue Spring to Twin River is one continued series of mining districts; and within which it is expected not less than a dozen mills will be put up the coming season.

Some twenty miles west of the Twin River country is Union district, in which there is a 10-stamp mill in operation, and several others in process of construction. Ten miles further west is the Mammoth district. Here two mills are in process of construction. Several heavy Eastern Companies are located here. To the south of this point is San Antonio district, where a first class 10-stamp mill has recently gone into operation, and where the prospect is good for the erection of others soon. West of this is the Esmeralda country, which is well known to our readers. Still further south is the Silver Peak country which gives evidence of soon becoming an important mining point. A 10-stamp mill is already in operation there and a 40-stamp mill nearly ready to start; several others are in contemplation. Clarendon district is 150 miles southwest of Austin, and fifteen west of Volcano district. We gather the above from the Nye County *News*.

Very rich developments have recently been made in the Manhattan Company's mines on Lander Hill.

Hunt's mill, at Indian Springs, near the San Antonio district went into operation on the 2nd ult. It is crushing ore from the Lee mine, which is said to be very rich.

The Confidence mill, at last accounts was about ready to go into operation. The Company's mine was rapidly being freed from water, and will soon be in a condition to yield a harvest of rich ore.

The *Revielle* is informed that important developments are being made on the Murphy mine. They have recently taken out of different excavations from 250 to 300 tons of ore that will easily yield $250 per ton by mill process.

HUMBOLDT.

We learn, from the Humboldt *Register*, that the Arabia mines continue to improve as the work of prospecting progresses. Work continues on the Bald Hornet, and the ledge looks better than ever. A new ledge, bearing the same character of ore, has been discovered near the Gloriana Series—the ore being as fine as any ever found in the district. The Daisy, having turned out to entire satisfaction lengthwise and in width, is now having its depth tried. At Oreana, "everything is lovely and the goose hangs high."

Another mill is on the way to the East Range. M. Milleson has organized a company to open the Ne Plus Ultra mine, of Sierra district. This company, if we are correctly informed, is composed of solid men, who know something of what a good silver mine is, and that it cannot be properly opened in a day, and without expense.

ESMERALDA.

The editor of the Esmeralda *Union* has conversed with gentlemen, who are practical miners, from Bodie, Silver Peak, Hot Springs and other adjoining camps, and all appear to be sanguine as to the future of their respective localities. The Crescent company, at Bodie, is reported to have struck it very rich, but as we have not been able to ascertain the facts, we merely give the report as we have heard it. There is hardly a week but what large freight teams are passing through Aurora, loaded with machinery for some of the adjoining camps, which to us appears rather flattering. Nearly all the ledges in the immediate vicinity of Aurora are owned by incorporated companies, many of whom will not work the mines themselves, or allow others to work them. The editor is satisfied that a good portion of these mines will pay well if properly worked, and thinks there should be some provision made compelling them to work or abandon the mines.

SALT LAKE.—The Salt Lake *Vedette* says: We recently witnessed assays of ores from the surface of four ledges in Rush Valley, thirty-eight miles from this city, which yielded from one to six hundred dollars per ton. The ore was argentiferous galena. When we consider that millions of tons of such rich ores, easy of access, are the prize awaiting the capitalist, we can form some idea of the vast wealth and power that will at no distant day, be here concentrated.

SHADOWS OF LOVE.—Old men's lives are lengthened shadows; their evening sun falls coldly on the earth, but the shadows all point to the morning.

There have been many religious, but there is only one code of morals.

Experiments with Sodium-Amalgam in Gold Ores.

BY PROFESSOR SILLIMAN.

Having at my disposal a considerable quantity of California gold quartz from a mine in Calaveras county, I proposed to Mr. Wurtz to subject these ores to his method of amalgamation, under conditions subject to control, both as expressing the actual value of the material experimented on, as well as giving the value of the results and the loss in the process.

For this purpose recourse was had to the crushing and grinding apparatus of Mr. M. B. Dodge, in New York city, which, doing its work dry, gives unusual facilities for exactness. The details obtained in these experiments as to the degree of comminution reached by this apparatus have been very carefully worked out, but are reserved for a future communication, having no bearing on the subject now before us, although believed to be of value to the art of ore-dressing.

Suffice it to say, we were able by this means to obtain a fair average sample of the entire amount of the ore treated—a thing of the greatest practical difficulty, as every assayer well knows.

FIRST SERIES OF EXPERIMENTS.

One lot of very poor ores, being quartz, showing no gold, but some iron pyrites, and much ochrey matter, being crushed and ground, gave of fine dry powder 525 pounds.

Several assays of this lot, made both at the U. S. Assay Office by Dr. Torrey, and also by Dr. Buck, a private assayer of excellent repute, gave an average value to the ore, on the ton of 2,000 pounds—

Gold	$13 50
Silver	1 33
	$14 80

The whole of this lot of 525 lbs. or rather more than a quarter of a ton of pulverized ore, was then treated in a Freiberg amalgamating pan, provided with 16 mullers and driven by steam power. In this apparatus the mass was first made into a thin paste with water, and then treated for one hour with twenty pounds of mercury, to which four ounces of 4 per cent. sodium amalgam was added in four successive doses, applied at about equal intervals of time during the process, the alloy being dissolved in a small part of the mercury.

On cleaning up the results of the experiment, and obtaining as nearly as possible average samples of the waste, the entire amount of mercury used in the experiment was recovered with a loss of less than one 320th of the original quantity. On careful distillation (retorting) the button of bullion melted at the United States Assay Office gave 0.1925 of one ounce troy of a fineness of 827 thousandths and a value of $3,295, or calculated upon the ton of 2,000 lbs., giving a value per ton of $14.03 of precious metal.

The tailings from this experiment yielded to assay a mere trace of gold too small to be weighed.

The concentrated sulphids washed from the tailings, and representing a very small fraction of the whole original mass, gave as the result of two assays

	$1,183.73
	1,140 63
Average	1,162.18 per ton of 2,000 lbs.

On calculating the ratio of these concentrated tailings to the whole mass it was found to be as 1 to 1700, giving about 70 cents as the bullion value additional to the bullion obtained by amalgamation, giving a total of $14.73, and differing by only 16 cents from the entire chemical contents as shown by the average of several assays.

In other words, the sodium amalgamation had in this experiment saved, practically speaking, all the gold in an ore containing less than $15 to the ton.

SECOND SERIES OF EXPERIMENTS.

Another lot of ores from the same mine, known to be much richer than the first, was in like manner ground to a fine powder, and very carefully sampled in a manner to secure a fair average.

Repeated assays, both at the United States Assay Office and at the private office of Partz & Buck, fixed the value of this sample of about 80 pounds of powdered ore at $320 per ton, the range of difference being quite moderate. The assays gave respectively $293.63, $332.78, $296.37, $368.22, $306.20, $320.36. One anomalous assay of $445.70 was rejected, as having beyond doubt involved a pellet of gold, carrying the result much above average. With this exception, the average result of the value of the whole quantity is very closely $320 per ton of 2,000 lbs. of ore.

In treating this sample a different mode of experimenting was adopted.

A small rotating cask, capable of treating 10 or 15 pounds of ore, was arranged in imitation of the usual Freiberg Barrel. In operating on small quantities of ore (10 or 15 pounds, for example,) the ratio of loss and error is much higher than in treating larger quantities, as in the great processes of the arts. We did not expect, therefore, to obtain in this series of experiments results as closely approximating the assay as in the first experiment, which was made upon a scale equal to that of the quartz mill.

EXPERIMENTS.

1. To make a comparative experiment, showing the relative saving power of common quicksilver and of the sodium amalgam, 5 lbs. of the ore were treated for thirty minutes with 2 lbs. of common mercury, which gave per ton of 2,000 lbs.

	$118.80 or 37.12 per cent. of the av'ge.		
The tailings of this experiment panned by hand with 1 oz. of magnetic mercury yielded an additional quantity.	67.20 or 21.00	"	"
	$180.00 or 58.00	"	"

2. 10 lbs. of the ore were next treated in the same manner with 1 lb. of common mercury 30 minutes, and the tailings panned in like manner with 1 oz. of magnetic quicksilver, giving in all per ton $182.60 or 57.1 per cent.

3. 10 lbs. of the ore with 1 lb. of common quicksilver for 30 minutes yielded

	$191.80 or 60 per cent.	
Tailings treated for thirty minutes with 1 lb. of magnetic quicksilver (¼ oz. No. 2 amalgam) gave in addition	63.60 or 20	"
Total	$255.40 or 80	"

No appreciable loss of mercury.

4. 10 lbs. of the ore treated for 30 minutes with 1 lb. of magnetic quicksilver, (¼ oz. of No. 2 amalgam,) and the tailings, as in No. 2, treated in a pan with 1 oz. magnetic quicksilver, yielded in all $266.40 or $83.3 per cent.

No appreciable loss of mercury.

These experiments are still in progress, but the results show that with unaided mercury the gold saved is less than 60 per cent. of the whole quantity of gold known to be present. In one experiment less than 40 per cent. was saved, while by the aid of the amalgam of sodium the saving is increased to 80 per cent., or 83 3 per cent., or an increase of more than 20 per cent., leading to the reasonable expectation that in the large way at least 80 per cent. of the gold present in a given case may be saved, and in many cases, where the gold is coarse and free, that even better results than this may be attained. The first experiment detailed in which a different amalgamating apparatus was used gave results surprisingly close. I do not think the barrel as good a form of apparatus for this description of amalgamation as some one of the numerous forms of pan now in use. It was employed in these experiments simply because it was a convenient means of treating small quantities of ore in making comparative experiments.

Experiments in California, under my direction, have been set on foot upon a scale of magnitude adequate to test the value of this discovery in the metallurgy of gold in a satisfactory manner, the results of which may now be looked for at no distant day.

The action of the sodium in this case appears to be in a manner electrical, by placing the mercury in a highly electro-positive condition toward the electro-negative gold, seeming to give some reason for the term *magnetic amalgam*, adopted by Mr. Wurtz as the trade-mark of the alloy. The quantity of sodium is entirely too small to allow the supposition that it acts by its chemical affinities.

It is well known to chemists that the metallic sulphids are decomposed by amalgam of sodium, but no one supposes that an inventor could be found so quixotic in his chemical notions as to seriously propose the use of sodium amalgam as a means of effecting the reduction of the sulphids of silver, etc., since not less than one equivalent of sodium would be required to set at liberty one equivalent of silver.

The use of the sodium amalgam for silver amalgamation must depend, if it is found really useful in the large way in the silver reduction process, (which still remains to be proven,) upon a like power of electrical action to that seen in its action on gold, and also to the well-known power of preventing the granulation (flouring) of mercury, or of saving the mercury when thus changed. Indeed, there is good reason for believing that a most important part is played by the sodium amalgam in this last particular. The amalgam of gold or silver is very liable, as every mill-man knows to his loss, to granulate and disappear from the plates of the battery, or from the riffles, after it has once been formed. If this granulation takes place it is almost impossible, by the existing modes of amalgamation, to recover the minute particles which float off with the currents of water and are lost. The action of the sodium in recovering mercury which has passed into this condition is perhaps its most remarkable property.

It is vain to stick your finger in the water, and, pulling it out, look for the holes; and equally vain to suppose that however large a space you occupy, the world will miss you when you die.

MINING AND SCIENTIFIC PRESS

PATENT AGENCY.

For the Pacific Coast.

OFFICE OF THE MINING AND SCIENTIFIC PRESS—No. 505 Clay street, corner of Sansome, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington.

The first question that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various papers and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we cause thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, our Washington agent has access to all the drawings, models, books and specifications filed in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra time involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, may employ us either by letter, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimentions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously. When the invention consists of an improvement on an old known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & Co., Mining and Scientific Press, No. 505 Clay Street, corner of Sansome, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance.

The following is the Government tariff of fees established by law:

On every application for a design, for 3 yrs and 6 mos...	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years.....	30
On every application for a patent, for seventeen years...	15
On every caveat.....	10
On issuing each original patent.....	10
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C....	25

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

N. B.—We make out our own forms for applications, etc., and would respectfully inform all parties that we have no printed blank forms for sale.

Commencement of Twelfth Volume

—OF THE—

Mining and Scientific Press

Published Every Saturday.

The title of our journal is a truthful expression of its character.

It affords a class of progressive information to the Miners, Mechanics and Professional Men of the Pacific Coast, which cannot be derived from books, or other publications.

Each Volume comprises, in reality, a book of new information and facts relating to Mining, Mechanism, Metallurgy, Science and Art, developed by our rich and peculiar resources, and identical with our own industry and history.

By the encouragement of intelligent economy in LABOR and GOLD-SAVING, we shall make the PRESS a source of INDIVIDUAL PROFIT to its patrons, as well as a public benefit to every local community in which it circulates.

The prospects of our journal are now brighter than at any former period. Our facilities for furnishing a valuable paper are constantly increasing.

Following are some of the many opinions generously expressed by our neighbors:

Editorial Expressions:

The publishers intend to make it the "Scientific American" of the Pacific Coast. Every miner should have a copy of it in his cabin, for it will be filled with useful information to the pick and shovel fraternity.—[Trinity Journal.

Should be taken by every man owning "feet" (and brains) in this State.—[Beacon.

In no other ten journals can the reader find the same amount of reliable mining news as in the PRESS.—[Contra Costa Gazette.

Every stockholder in different mines will find it will pay to take and read this mining journal.—[Contra Costa Gazette.

The PRESS is to the Pacific Coast what the "Scientific American" is on the Atlantic. It deserves its success.—[Aurora Daily Times.

It is fully up to the times, and furnishes the latest mining improvements and intelligence.—[Calaveras Chronicle.

Every miner should subscribe for the PRESS.—[Calaveras Chronicle.

It presents a channel through which all mining notices may be cheaply consolidated into one sheet for the convenience of all stockholders.—[Mountain Messenger.

We can give our testimony that it is always replete with useful and valuable information to miners and mechanics.—[Placer Herald.

It contains correspondence from different sections, giving accounts of new discoveries in gold, silver and copper, and should be taken by every person that wishes to keep well posted on the developments of our State and the Territories.—[Mountain Messenger.

With the last number is an index to the whole volume, most useful and valuable to those who keep files of that paper.—[Shasta Courier.

Prof. J. D. Whitney's address on Mining, is given entire. * * * We preserve the PRESS, and would like to have a full file.—[Napa Reporter.

The public should support the enterprise of the MINING PRESS, one of the best papers in the State, by a liberal patronage, as it is only by a system of legitimate reports that our mines can be favorably brought before men of capital below.—[Calaveras Chronicle.

Under the management of Messrs. Dewey & Co., the PRESS has been much improved in every respect. * * It deserves a liberal support.—[Virginia Union.

A good paper for this country.—[Humboldt Register, Nu.

Those who would have a good paper of this character, should subscribe now.—[Marysville Appeal.

It embraces one of the finest fields in the world, and seems to improve it. * * * It will be second to no scientific record now published on this continent.—[Los Angeles News.

A neat and useful journal. One of the most presentable and useful in the State.—[Sunday Mercury.

Such a journal has been needed on the Pacific Coast. The PRESS fills the bill.—[Reese River Reveille.

A splendid paper, and should have a good list of subscribers in prosperous Grass Valley.—[G. V. National.

We receive, regularly as clock work, this exceedingly valuable and interesting journal.—[Napa Reporter.

Interesting and important to miners and Mountain men. [Butte Record.

Friends pleased with our efforts in the publication of the PRESS can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

SUBSCRIPTION IN ADVANCE.

One Year, (two volumes)	$5.00
Six Months, (one volume)	3.00

☞ BOUND VOLUMES FOR SALE.☜

FOR ADVERTISING

Our terms are very reasonable. MINING COMPANIES are especially favored by our rates, and careful attention is given to the legal publication of MINING NOTICES.

OFFICE—No. 505 Clay street, corner of Sansome.

DEWEY & CO., Publishers.

W. M. SMITH ..... W. A. EWER. ..... A. T. DEWEY.

Mining and Scientific Press.

W. B. EWER,.....SENIOR EDITOR.

C. W. M. SMITH. W. B. EWER. A. T. DEWEY.

DEWEY & CO., Publishers.

OFFICE—No. 505 Clay street, corner of Sansome, 2d floor.

Terms of Subscription:

One copy, per annum, in advance,.....$5 00
One copy, six months, in advance,..... 3 00

☞ For sale by Carriers and Newsdealers. ☜

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited on all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

Mr. Wm. R. Bradshaw, is our Special Correspondent and Traveling Agent. All favors or assistance rendered him in his progress through the country in behalf of our journal, will be duly acknowledged.

SAN FRANCISCO, Jan 1st, 1866.

Mr. A. C. Knox, is our fully authorized Traveling Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.

SAN FRANCISCO, Jan 11th, 1866.

Mr. Elwin Davis, is authorized to solicit subscriptions, advertising, etc., for the MINING AND SCIENTIFIC PRESS, in San Francisco, and to receipt for the same.

San Francisco:
Saturday Morning, Mar. 3, 1866.

Endorsement by the Miners' State Convention.

The following resolution was adopted by the California Miners' State Convention, held at Sacramento, Jan. 17th, 1866:

Resolved, That we regard a mining paper or journal of great importance to the mining interest of California, and we recommend the MINING AND SCIENTIFIC PRESS, of San Francisco, to the consideration and support of the miners of the Pacific coast.

THE OIL PROSPECTS OF HUMBOLDT.—The Humboldt *Times* of the 24th inst., furnishes the following information with regard to the progress of the oil interest in that county: "The well of the Eel River Oil Company, on the farm of J. T. Barber, is down 145 feet, and the prospects of the company are looked upon as quite favorable. From the Bear River and Mattole districts, reports are also encouraging. The Jeffrey well, the Irwin, Davis, Yosemite, Annehogeau, Mendocino, East Fork Mattole, have also been heard from. No oil had been struck yet, but the work was proceeding with an energy which promised soon to release the oleaginous treasure from the bowels of the earth." In regard to the well of the Eel River Company, we have seen a letter the past week from one of the parties engaged in sinking the same, which stated that the well, at the time of writing, was 174 feet deep, with most excellent indications. The bore passed through the gravel into the sandstone at the depth of only ninety feet, when more than double that depth was expected. The geological indications of the Eel River valley are much more favorable for an abundance of oil and for flowing wells than any other part of Humboldt county, for reasons given in our issue of September 23d. This opinion appears to be fully endorsed by Prof. Wm. P. Blake, the Director of the Mining Department connected with the College of California, at Oakland, who uses the following language in his report on the Humboldt oil region, addressed to Col. S. G. Whipple, under date of December 14, 1866: "I must here call your attention to the possibility of getting oil from the top of the fissures under the *nearly horizontal strata* of Eel River valley. Possibly these upper strata may confine oil that rises from the more highly tilted and broken strata below, for I believe that the oil shales underlie the whole valley."

THE population of London is over three million, and every week two thousand are born and fifteen hundred die.

OVER 40,000,000 letters were received in the Chicago Postoffice, for distribution to other offices, the past year.

THE STATE CAPITOL BUILDING.

The State Capitol Building, at Sacramento, for the completion of which an additional tax bill has passed the Legislature, has so far progressed as to justify the hope of its completion in a few years; the structure also gives promise of being, when completed, one of the finest buildings in the world, and surpassed by none on this continent, but the Capitol at Washington. Some idea of its size and character may be found from the following items: It is over 300 feet front, including porticos, with center and end wings, and 76 feet from ground line to top of balustrade. The dome is 72 feet in diameter at its base, and with two stories of portico or tomhour, rises 216 feet from the ground line. There are twenty columns thirty-eight feet nine inches high, on the sides, rear and front; the latter supporting a tympanum on which are to be sculptured the figures of Mining, Commerce and Agriculture. There are also seventy-six pilasters, which form the division between the three stories of boldly arched windows, of which latter there are 172 in the building. The lower story, which forms the basement to the superstructure, has a sub-cornice and a full Corinthian cornice, which crowns the entire building—a girth of over 1,300 feet. The entire facade, capital, etc., are to be finished like the parts already completed, in beautiful white granite, from the slate quarries in the neighborhood of Folsom. The basement, or first story, contains the Supreme Court Room, and its adjuncts; besides offices for the Governor, Secretary of State, Controller, State Treasurer, Attorney-General, Surveyor-General, Public Instruction, etc., etc.—twenty-eight rooms in all, with all the minor appointments, and, like the two other stories, this is intersected by the center rotunda, and three large halls, sixteen feet wide. The second, or principal floor, which is reached by three ample stairways from the interior, and a noble structure of granite steps in front of the main portico, contains the Senate and Assembly Chambers, and State Library, each forty-six feet in hight, with galleries, and finishing with low domes, besides fourteen large rooms for the State officers. The third story has three large rooms for State Museum, and seventeen Committee Rooms.

The building has now progressed to the vault of the rotunda, or top of first floor, and what has been done in the ontlay of some $350,000, is a satisfactory evidence of the constant care and attention it has received from the Governor and Board of Commissioners. All the materials with which it is constructed are of the best kind and perfect in their finish and adjoinings. The whole structure will be entirely fire-proof, the floors being vaulted with iron and brick, and covered with marble and encaustic tiles. By the estimates of the present architect, Mr. Gordon Cummings, $1,012,838 are yet required to complete the structure, which may be accomplished in four or five years.

The bill which has just passed both branches of the Legislature, and received the Governor's signature, appropriates $150,000 per year until the structure is completed. There was considerable opposition to the bill on its first introduction; but its friends rallied promptly to its support, and secured its passage. The building, so far as completed, presents a truly beautiful appearance, and if finished after the manner and with the material proposed, it will be an ornament to the city of Sacramento, and reflect the highest credit upon the taste and enterprise of the Golden State.

FINE SPECIMENS.—We acknowledge from Mr. George Barrington the receipt of a fine specimen of cemented gravel, well sprinkled with gold, taken from the claims of Messrs. Neece & Pest, near You Bet. If we are not mistaken in the locality, we have a slight recollection of doing some pretty hard work on that claim in 1853–4 for very small pay. We are pleased to learn that the present proprietors are getting better paid for their labor than we did. We trust it may continue to pay, as it possibly will, for the next twenty years. A few tons of gravel, equally rich with the specimen before us, ought to be sufficient to satisfy the most avaricious of mortals.

MECHANICS' INSTITUTE.

At a regular meeting of the Institute, on Thursday evening last, it was voted to adopt the report of the committee recommending the purchase of the ground known as the "Hyde lot," on Post street, between Montgomery and Kearny streets, of Mr. Randolph, for the sum of $25,000. The lot is about 74 feet front on Post street by 85 feet in depth, on the east side, and 120 feet on the west, being of an irregular form, conforming to the peculiarity of the streets between which it is located. It is the desire of the Institute to dispose of its present building on California street, and immediately build a more commodious structure, such an one as is already greatly needed to meet the growing wants of the Institution. The meeting was largely attended, and a lively interest manifested throughout its proceedings, which lasted until about 11 o'clock. An adjourned meeting, to take further action, in accordance with the report of the committee, will be held this (Saturday) evening.

The Annual Election of Officers of the Institute takes place on Monday next, March 5th, between the hours of 12 M. and 9 P. M. The following tickets have been nominated, and a lively contest is anticipated:

Regular Nominations.	*Opposition Nominations.*
FOR PRESIDENT.	
H. J. Booth,	Charles M. Plum.
FOR VICE PRESIDENT.	
D. A. Macdonald,	A. C. Austin.
FOR RECORDING SECRETARY.	
Robert Riddle,	Jason B Pierce.
FOR CORRESPONDING SECRETARY.	
A. S. Hallidie,	A. T. Dewey.
FOR TREASURER.	
Edward Nunan,	Thomas Young.
FOR DIRECTORS.	
James B. Johnson,	Joseph McGill,
P. J. O'Connor,	N. W. Spaulding,
Henry Webb,	W. W. Hanscom,
John W. Farren,	Chas Elliott,
F. G. Edwards,	R. S. Eels,
James Spiers,	Hiram Rosekrans,
Wm. T. Garratt.	W. C. Pease.

A SINGULAR SPIDER.—At a recent meeting of the California Academy of Natural Sciences, Prof. W. P. Blake remarked that Dr. Jackson of Boston had recently described to him, by letter, a remarkable spider, brought by Dr. Wilder from Long Island, Georgia, and which is now attracting much attention from the naturalists of Boston. This spider is about as large as a Tarantula and lives on the pine trees. It spins both gold and silver-colored threads of great strength and brilliancy. Dr. Wilder wound out five (5) miles of golden-colored silk from one of the spiders, and quite a quantity of the silver-colored thread, and without injury to the spider. This thread looks on the reel like burnished gold. It is elastic, while the silver-colored silk is non-elastic and is used for the main stays of the web, while the gold thread fills in the rest of the web. Dr. Wilder has a lot of the spiders living in the Cambridge Conservatory, and many young broods in his room in Boston. The Dr. has made full communications to the American Academy, and to the Boston Society Natural History.

MINING ENGINEERS.—We would call the especial attention of our readers to the card of Messrs. GOODYEAR & BLAKE, which will be found in our columns to-day. These gentlemen are both personally known to us, and present testimonials of the highest character as to their qualifications and experience as civil and mining engineers and metallurgists. Being familiar with all the modern languages, parties not speaking English may be able to consult them with greater advantage and facility. They are prepared to make surveys and maps, to examine and report upon mining and other properties, to make plans and estimates, to superintend the construction of engineering works, and to transact any other business pertaining to their profession as civil and mining engineers.

A FACT is disclosed by a late report of the New York Inspector of State Prisons, that while all other occupations are represented in their great number of convicts, there is not a single printer.

THE Healdsburg (Sonoma county) *Standard* says there is not a rat in that burg.

MORE EXPERIMENTS WITH SODIUM AMALGAM. We have given, on another page, a detailed account of some experiments recently made by Professor Silliman, of Yale College, with regard to the economy of the use of sodium amalgam in saving gold from its ores. The paragraphs which we give, together with a lengthy introduction, was read by the Professor before the Academy of Natural Sciences, at its late meeting. The Professor also stated, at the same time, that the March number of the *American Journal of Science* would contain a still more detailed account of this valuable discovery. The high standing of Professor Silliman, as a chemist, renders the result of his investigations a matter of the first importance; and warrants the public in placing the utmost reliance upon the data and figures which he gives. The paper cannot fail of being read with much interest by all persons engaged in gold mining. The expressed opinion of the gentlemen, before whom it was read, was, that it was "one of the most practical and most interesting papers which had ever been brought before the Academy." The Professor awards the merit of this discovery to the party to whom it properly belongs—Prof. Henry Wurtz, of New York, who communicated the results of some preliminary experiments to him early in 1864. We shall allude to this matter further next week.

CALIFORNIA MADE BELLS.—The success with which Mr. W. T. Garratt, of this city, is meeting in the manufacture of bells, would seem to fully obviate the necessity of sending to the East for such articles. We examined a bell of his manufacture, a few days since, at his establishment, on Market street, which, for beauty and fullness of tone, and completeness of finish, is not surpassed by any imported bell which has ever been landed in California. Another interesting thing connected with this bell is the fact that the copper which has entered into its composition, was mined and smelted in California. The bell bears upon its surface, in raised letters, the following inscription: "Mined from the Union Mine; smelted at the works of C. T. Meader; cast by W. T. Garratt; presented by C. T. Meader." The bell weighs 800 pounds, and is a donation from Mr. Meader for use upon a school-house in Stockton. Mr. Garratt is prepared to cast bells of any weight which is likely to be called for on the Pacific coast. He has also devised a method of hanging bells, which possesses decided advantages over any other heretofore devised. The bell is securely held by a single bolt, which passes through the crown, and is held firmly to its place by two nuts. By simply loosing one of these nuts the bell can be turned so as to present any portion of its interior surface to the blows of the clapper, an advantage which many deem of much importance. This arrangement does away with the cumbrous and complicated attachment by which bells are usually secured to the crown.

We understand that but very few bells are now being imported, and purchasers would do well to bear in mind that there is now no necessity for such importation; and that by patronizing an enterprising California House, they may soon build up here a new and important branch of business, and keep much money at home. The bells cast by Mr. Garratt are fully equal in tone to any imported, and are warranted not to crack within one year; if by any chance they should do so, they will be recast without any expense to the purchasers. Any inscription that may be desired will be cast upon his bells, without extra charge and they will be furnished as cheap or cheaper than they can be imported.

ELECTION.—Adams Petroleum Oil Co., Contra Costa.—February 7th. Trustees: Alonzo Green. S. B. Whipple, Jns. T. Cruikshank. President, Albert Green; Secretary, Paul Neuman; Treasurer, Philip Wolf.

RECENT INCORPORATIONS.—Tear and Rip Copper Company; location, El Dorado county, Cal. Capital stock, $540.000, divided into 5,000 shares, $400 each. Trustees: W. Thompson, Jr., Henry Thompson, Richard Hammon.

RIPPON G. & S. M. Co., Silver Mountain, Alpine county.—Capital stock, $300,000, divided into 3000 shares, $100 each. [Corrected.]

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

San Francisco, Saturday Morning, March 3d, 1866.

The amount of capitnl offering for loan purposes shows no abatement, amply supplying tho wants of all classes who can furnish the requisito security. A fair demand prevails in bank circles, and choice names aro passing at 1@1¼ ₱ cent. per month, the lattor being the current rate for the usual discounts made. In the open market negotiations are effected at 1½@2 ₱er cent., according to the collateral offering.

Receipts of treasure from the interior and North const, since the date of our last referenco, amounted to $900,000. Bullion met with considerablo inquiry early this week, and sales of fine gold bars for the China market were made at 855@865, but the closing quotation is about 850. Silver bars rango at ¾@1¼ ₱ cent. premium.

City Railroad shares aro u shade firmer, in view of n probable increase in the future earnings of different companies. North Beach and Mission was sold at $49 per share, and is now held at $49. Central is inquired for at $60, and Omnibus can bo sold at $48 per share. San Francisco Gas is in request at $107 per share, and Spring Valley Water was sold at $60. Tho latter company will resume tho payment of dividends tho ensuing week, and probably continue them regularly hereafter. California Steam Navigation rose from 55½ per cent to 57, and closes at 56.

Insurance stocks are in rather less favor, and some have been freely offered recently at n decline from former quotations; Union is held at $113, Pacific at $164, and California Home at $100. California can be sold at $1,600 per share, and the Merchants Mutual at about $2,250. Fireman's Fund was dealt in at $123@123½, and the National (now) is inquired for at $78½ per share.

The Mining Share Market has exhibited more animation this week, and nearly every stock on tho list has been actively dealt in at enhanced rates. Advices from a number of promiuent claims are still favorable, and more money was actually earned in February than in any previous like period for six months past. If the present condition of several mines should continue no less flattering awhile longer, it will have an important influence upon the market value of all stocks.

Gould & Curry receded from $975 to $920, then sold at $925, and closed at $925 bid. The body of ore in the "2d Station" has now been traced n distance of some 25 feet laterally in the south drift, but no cross-cutting has yet been done. The company have accumulated a surplus, and a dividend may be looked for next month.

Hale & Norcross has materially improved, and small sales were made, advancing from $1,020 to $1,200, receding to $1,150, rallying to $1,180, and selling yesterday at $1,225@1,215. The lower floor of the vein in the 700-feet level shows a width of 25 feet of good ore in going north, and the pay portion has now been partially prospected a distance of 150 feet in length. The ore product of the mine is averaging 50 tons per day, including some 5 tons 1st-class ore. Receipts of bullion last month exceeded $36,000. The assessment of $50 per foot, levied January 29th, has been rescinded, and the company have now a surplus in their treasury.

Crown Point receded from $1,080 to $1,030, rose to $1,080, declined to $1,040, and was held yesterday at $1,100. During the week ending February 23d, 748 tons of ore were extracted from the mine. The north drift in the lower level is now within 20 feet of the north line, and no material variation has taken place recently in the appearance of the vein. The incline is down 20 feet from that level in a large body of excellent ore. Late crushings show an average of $45 @$48 per ton, and the company's receipts of bullion for the first three weeks of last month exceeded $100,000.

Savage has been dealt in to the extent of 185 feet, advancing from $835 to $890, dropping to $830, rising to $945, receding to $890, and selling yesterday at $930@950.

The product of the mine in February averaged, it is said, about 80 tons of ore per day, worth some $55 per ton, and the net profits are estimated at $58,000. The indebtedness of the company at the present time is about $20,000, not including the contracts for the new works, and $27,000 due upon the Minnesota mill. Most of the ore is now taken from the upper stations, the 5th level not having proven very productive. The main shaft has been sunk 40 feet (one-half the required depth) in the last two weeks. The drift running southwest from the bottom of the winze, to intersect the main shaft, has been run 60 feet, but some time will be required to make that connection, and open the new or 6th level. The prospecting so far, at this depth, is said to promise a good body of ore. The new shaft, E street, is down 230 feet, and 210 deeper will bring it on a level with the ore found in the Hale & Norcross mine, and 208 feet east of the line of the latter company.

Yellow Jacket has been active, and some 300 feet were sold advancing from $395 to $455, receding to $425, rallying to 442½, and then selling at $440@435. During the week ending February 19th, 657 tons of ore were extracted, and 394 tons were worked at outside mills, yielding $11,707.19, an average of $29.66 per ton. In the same period $16,800.67 in bullion was received from the company's mill.

Ophir steadily rose from $415 to $445, and then sold at $440@445. It is said that the reserve of ores and tailings on hand at the Reduction Works are worth some $90,000 net. Five new stamps and other improvements have been recently made to that establishment, giving it a reduction capacity of 750 tons per month.

Chollar-Potosi is in more favor, advancing from $322 to $370, and selling yesterday at $360@355. During the week ending February 23d, 785¾ tons of ore were sent to custom mills.

Belcher has improved a little, and some 100 feet changed hands, advancing from $195 to $270, and then selling at $265@225. Some favorable indications have been met with recently.

Alpha has been dealt in within a range of 280@257½, closing at $275. An assessment of $30 per share (120 per foot) was levied February 20th. Empire Mill and Mining is in more favor, advancing from $180 to $210 per share, closing at $210 bid.

Imperial declined from $123 to $114, rose to $126, seller 10, then sold at $126, and closed at $130. The yield of bullion for the month of February amounted to some $75,000. The "Imperial-Empire" shaft has attained a depth of 100 feet, and the old shaft has been sunk 46 feet from the bottom of the sump—in all 66 feet from the lower level. Preparations are being made to extract sufficient ore from the Holmes ground to keep the Gold Hill mill actively employed.

Confidence has been in favor, and some 500 shares were dealt in, advancing from $70 to $102, receding to $90, rallying to $101, and selling yesterday at $100@70. A very considerable body of good ore has been developed recently.

Overman has been more active, some 600 shares changing hands within a range of $55@72½, closing at about $70. An assessment of $15 per share was levied February 28th.

Bullion fell from 60 to 52½, rose to $66, and then sold at $62@$60. Exchequer was dealt in to the extent of about 800 shares, within a range of 6¾@7¾, closing at $7¾.

The aggregate recorded sales of Stocks and Legal Tender Notes, since Saturday last, amounted to $861,294 75.

Say what is well, and do what is better; be what you appear, and appear what you are.

Let your behavior, like your garment, be neither straight nor loose; but easy and becoming.

Some persons are above our anger, others below it. To contend with our superiors is indiscretion, and with our inferiors is indignity.

A Beautiful Illustration of Life.—Our boat at first goes down the mighty channel—through the playful murmuriog of the little brook, and the willows upon the glassy borders. The trees shed their blossoms over our young heads, the flowers on the brink seem to offer themselves to our young hands; and we are in hope and grasp eagerly at the beauties around us; but the stream hurries on and still our haods are empty. Our course in youth aod manhood is along wider and deeper floods, amoog objects more strikiog aod magnificeot. We are animated by moving pictures of eojoy-ment and industry passiug us; we are excited by our short-lived eojoyments. The stream bears us on, and joys and griefs are left behind us. We may be shipwrecked but we cannot be delayed for rough or smooth, the river hast-ens towards its home, till the roar of the ocean is in our ears, aod the waves beneath our feet, and the floods are lifted up around us, and we take leave of earth and its iohabitants until of our further voyage there is no witness save the Infinite and Eternal.

The beloved of the Almighty are the rich who have the humility of the poor, and the poor who have the magoanimity of the rich.

Trades and Manufactures.

Pacific Glass Works

Are now prepared to execute orders for the manufacture of

All Kinds of Bottles to Order.

Office, No. 621 Clay street, San Francisco. 3v11-3m

JOHN DANIEL,
(SUCCESSOR TO O. GORI)
MARBLE WORKS,
No. 403 Pine st. bet. Montgomery and Kearny, San Francisco.

Mantels, Monuments, Tombs, Plumbers' Slabs, Etc., On hand and Manufactured to order.

☞ Goods shipped to all parts of the State. Orders respectfully solicited. 5v8-3m

NATHANIEL GRAY,
General Furnishing Undertaker,
641 Sacramento St., corner of Webb, San Francisco.
Burstow's Metallic Burial Caskets and Cases.
1tf

THEODORE KALLENBERG,
Maker of Models for Inventors.
MACHINES, MATHEMATICAL, OPTICAL AND PHILOSOPHICAL Instruments, Scales, Weights, etc. Steel Stamps, Dies and Die Sinking, Embossing Stamps. Repairing of machinery promptly attended to.
No. 418 Market street, San Francisco. n7-tf

Palmer's Patent
ARTIFICIAL LEG,
Manufactured in Philadelphia, Penn.
JARVIS JEWETT, AGENT.
629 Washington Street, San Francisco, Cal. 10v8-1m

DENIS WHELAN,
Fashionable Boot Maker,
REPAIRING NEATLY DONE, AT SHORT NOTICE.
No. 17 Fourth Street,
Near Market street, San Francisco.
15v10-1m*

FIRE, HYDRAULIC & SUCTION HOSE,
And Leather Belting.
M. M. COOK & SON,
801 Battery Street, San Francisco,

Are now manufacturing as above, Fire, Hydraulic and Suction Hose, and Leather Belting, of any dimension and in any quantity which may be desired. Fire Hose and Belting constantly on hand or manufactured to order. Also Saddles and Horse Collars.

The subscribers would respectfully ask purchasers to call and examine their stock—also testimonials of the efficiency of their work from such as have used their hose both for fire and mining purposes. A diploma was awarded to us last year, by the Mechanics' Institute, of this city, and a silver medal this year. 12v11-1y

Lines for Ferry Boats,
Manufactured to Order.
Office at TUBBS & CO.'S,
Nos. 611 and 613 Front street
Manufactory at the Potre 14v10

Professional Cards.

Our Patent Agency.

The Patent Agency of the Mining and Scientific Press has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of Letters Patent from the United States and foreign Governments can not be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

S. C. BUGBEE & SON,
ARCHITECTS.
DESIGNS, MACHINE DRAWINGS, AND DRAWINGS ON WOOD.
74 and 75 Montgomery Block
SAN FRANCISCO. 25v10-3m

FREDERICK MANSELL.
Mechanical & Architectural Draughtsman,
No. 422 California street, corner of Leidsdorff.

Drawings of Models made for parties applying for patents at Washington or London. mar23-tf.

JAMES M. TAYLOR,
Attorney and Counsellor at Law,
COURT COMMISSIONER, appointed by the Fourth District Court, COMMISSIONER OF DEEDS for Nevada and Massachusetts,
Court Block, San Francisco.
Entrances opposite City Hall, Merchant street, and 636 Clay street. 14v11tf

Mining Engineer,
No. 57 Montgomery Block, San Francisco,
Will examine, survey and report upon mines, and consult and advise concerning investments in mining property, or the machinery management and expenditures of mines.
22qy

To Mining Companies.

A GENTLEMAN OF MUCH EXPERIENCE AS A MINing Superintendent, in England, Spain, and on the Pacific coast, and one intimately acquainted with every department of mining, and with nearly every class of mineral, is desirous of securing a position as Superintendent of some mining operation in California or Nevada. The applicant was for four years Superintendent of the New Almaden Quicksilver Mine, in this State. The best of reference given on application at this office.
San Francisco, Oct. 12, 1865 .5v11tf

REMOVAL.
MONS. A. COULON,
Informs his patrons that he has removed his DRAWING SCHOOL from Pine street to
410 Kearny Street.
Drawing Classes in the Evening will take place as usual. DRAWINGS FOR PATENTS accurately and neatly done. 20v11-1m

Volume Twelfth.—The Mining and Scientific Press, with its last issue, commenced its twelfth volume. Since Dewey & Co. have "held the ribbons" its gait has been rapid toward a perfect journal. Its appearance evidences its prosperity, but doubtless, like some of the rest of us, it can stand increased encouragement. Let such be given, and, our word for it, volume thirteen will acknowledge receipt.—[Golden Era.

Metallurgy.

MOSHEIMER'S CONCENTRATOR
RECEIVED THE FIRST PREMIUM

From the ROYAL POLYTECHNIC SOCIETY, in Cornwall, and was highly recommended by the Commissioners as the most Simple and Effective Concentrator for all kinds of Ores.

Every Quartz Mill ought to have them, as they not only save Gold and Silver, but also the Quicksilver and Sulphurets, without extra labor. They can be built entirely of wood at the mine, and will separate more perfectly in one operation, than any other Concentrator in use. Apply to

J. MOSHEIMER,
23v11qy 423 Washington street.

EUROPEAN
METALLURGICAL WORKS,
—AND—
Practical Mining School,
Bryant Street, Between Third and Fourth,
SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

S. P. Kimball, J. R. Murphy.

A Business Compliment.

PETALUMA, Oct. 4, 1865.

MESSRS. DEWEY & CO.—Gentlemen: Your note informing me that my patent for Crushing and Baling Machine is ordered to issue is at hand. Please accept my thanks for the prompt and business-like manner with which the case has been conducted, and inclosed find twenty dollars for balance Government fees. Respectfully, etc.
JACOB PRICE.

AN EXPERIMENT WITH THE POKER.—An experiment of a similer character to the above may be made as follows: Tie a string round the handle of a poker, or other similer long piece of iron, leaving the two ends of the string about a foot long. Now take the ends of the cord, and pass them one over each ball of the thumb, so that the poker can be lifted up and suspended between the hands. In this position place the thumbs and ends of the cord as close into each ear as convenient. If now a second person strike the poker, the one who holds it will hear a sound very surprising when experienced for the first time, but scarcely audible to the striker. If the blow be a sharp one, and struck with a hard body, as the back of a knife, the sound will be as strong as the deepest note of a piano, and if a hard blow with a hammer the sound will appear as powerful and booming as a stet bell. If the experiment be made with a large kitchen poker, then the sound is "stunning," and equals anything that can vibrate from the City Hall bell.

Another curious instance of the same class of facts, as given above, in relation to sounds, may be found in the story of a man employed in the American Telegraph Company's office in Washington City, who, though he cannot speak or hear, is classed as a first-class operator, dealing with sounds. He can send and receive dispatches intelligently by the sense of feeling. He places his leg against that of an instrument-table, and in other ways reads by the slight jarring, while watching the operation of the instrument itself; and he thus understands all the machine is talking about.

HEARING WITH THE TEETH.—That faculty which we call "hearing," can be as well conveyed to the mind by means of the teeth as the ear. Curious as this assertion may appear, it is easy to prove it by the following simple experiment. Lay a watch upon a table, glass side downwards; then stand so far from it that you cannot in the ordinary way hear the ticking. Now place one end of a small stick (say six feet long) upon the back of the watch, and grip the teeth upon the other; with the fingers close each ear, to exclude all external noise; the beat of the watch will then be as audible as if placed against the ear. All other sounds can be conveyed in the same manner, no matter how long the stick is; for instance, if one end is put upon a pianoforte in a sitting-room facing a garden, and the stick is thirty or forty feet long, extending to the further end of the lawn or walk; if the instrument is ever so lightly played, "the tune" will be instantly distinguished by any person applying the teeth to the opposite end of the stick.

NAPOLEON, in his solitude, is said to have used the expression,

"Able was I, ere I saw Elba;"

which is the same spelled backwards.

LONGFELLOW'S poem, "Excelsior," was refused publication, when offered to the New Bedford Mercury, years ago—the editor thinking it a very foolish production.

THE Methodist Episcopal Church contains nearly a million members.

Experiments for Children.

Place a common iron Japaned tea-tray on a dry, clean drinking-glass, or on two or more of them; then take a sheet of paper and bold it to the fire until it becomes thoroughly dried but not scorched. (Recollect that paper is always more or less moist from contact with the atmospbere; hence the necessity for drying). Now lay the paper on the table, and take a piece of India rubber and pass it lightly across the same from left to right, as if you were rubbing out pencil marks. Let it be drawn across about a dozen times, beginning at the top of the sheet and making each stroke a little lower down, until you have passed the rubber once or twice over the entire surface.

Now take up the paper by two corners, and bring it over the tray, and on dropping it you will see it fall almost like a sheet of iron. Supposing you have done everything right up to this point; if you now place the end of one of your fingers near the under surface of the tray, you will feel a sensible electric shock.

Now place a needle on the tray, with its point projecting outwards, remove the paper, and a star sign of negative elicitricity will be seen, if the room is dark enough; return the paper and the positive *brush* sign will appear. This arrangement will form, in fact, a very good *electrophorus*—an instrument for exciting electricity. It is sometimes sufficiently powerful to give a spark an inch long, strong enough to set fire to light combustible bodies, and may be made to exhibit, on a small scale, most of the ordinary electrical phenomena, not requiring coated surfaces.

A very interesting class of experiments may be made with it in the following manner: Take four or six tumblers, place them bottom upwards on the floor, lay a hook upon them; then let a person stand upon the hook, and he will be in what is called an *insulated* position—that is he will be so conditioned that the electricity which may be conveyed into his body will not readily pass off. When standing in the position described, if he takes the tray, charged as we have also described, from *its* insulated position on the glasses, the paper will still adhere to it although he may hold it vertically, or banging by his side; and while so holding it, sparks of electricity may be drawn from any part of his person by placing the end of your finger near him; or he may draw sparks from other persons as the case may be. Under peculiarly favorable circumstances he may light the gas by holding his finger to the burner as you would a match! He may even light it *by holding a piece of ice to it!* These experiments are easily performed, perfectly safe, amusing and instructive, especially when the parents or teachers assist in them and explain their nature more fully than we have done.

How to Burn Iron.—Take a file and rasp off half an ounce of iron; then put out your gas lights, if you have them, and light a solitary candle. Take up a pinch of the filings and hold them just above the flame of the candle and gradually drop them. You will find that they take fire immediately on coming in contact with the blaze, and burn most brilliantly; each particle burning like a star, and the whole presenting a very pretty example of miniature brewerks. The principle is just the same as that upon which the finer you split up your wood the more readily it will burn. You can burn up the entire poker in a short time, if you will only reduce it to filings.

Size of the West.—The "La Crosse Democrat" says: Illinois would make forty such States as Rhode Island, and Minnesota sixty. Missouri is larger than all New England and Ohio exceeds either Ireland or Scotland, or Portugal, and equals Belgium, Scotland and Switzerland. Missouri is more than half as large as Italy, and larger than Denmark, Holland, Belgium and Switzerland. Missouri and Illinois are larger than England, Scotland, Ireland and Wales.

The First Known Sale of Land, of which we have any record, is thus recorded in the Bible:—"Ephron, the son of Zobar, made sure unto Abraham, for a possession, his field which was in Machpelah, which was before Mamre, the field and cave which was therein, and all the trees that were in the field, that were in all the borders round about." Our young readers may find it a useful exercise to hunt up the book, chapter and verse where it occurs.

An Italian inventor named Casolari has recently produced a mechanical press, by which, it is said, a speech may be printed while it is being delivered, and be all ready for publication at the time the speaker leaves the platform. A public trial of it recently took place at Modena, when five stanzas of Dante's great poem, together with a learned commentary on the same, were read and printed from the reading in lines containing each thirty letters, in the space of nine seconds.

It takes but a moment to cloud a lovely morning, and a slight misdeed may mar the happiness of a lifetime.

PROSPECTUS

OF THE

California Youths' Companion.

PUBLISHED EVERY FRIDAY,

BY DEWEY & CO.,

Of the Mining and Scientific Press, Patent Agents, Book and Job Printing Office, 505 Clay Street, corner of Sansome, San Francisco.

SUBSCRIPTION PRICE:

For One Year, $2.50; One Quarter (12 weeks), 75 Cents. Liberal discounts will be made to Clubs in the Interior, and to Classes in this city.

In the management of the Companion, we shall endeavor to express ourselves pleasantly, in simple language, and in a manner perfectly comprehensive to children. We shall aim to encourage them to become good, wise, and happy.

We shall give, from time to time, illustrations, calculated to attract their attention, and to impress upon their minds ideas not otherwise easily understood—in short we shall use the engraver's beautiful art to light up the pathway of progress for children.

Stories, when published, will be short, calculated to instruct as well as amuse; and we shall endeavor to make it a point that such contributions and selections shall always be of a high moral character.

Humorous sketches and amusing incidents will occasionaly find an appropriate place to spice our columns.

We shall have an especial care to exclude all unchaste or improper paragraphs and expressions, admitting nothing into the columns but such as shall have a tendency to improve and ennoble the youthful mind.

We shall endeavor to so blend rational amusement with instruction, as to render all our efforts in that direction, pleasing and desirable, rather than dull and uninteresting.

We have in course of preparation a set of skeleton engravings—some two hundred in number—which we propose to make a feature in the paper or the present year. These engravings are designed to illustrate a healthful class of exercises.

Friends pleased with our efforts to provide for the school children of California a first-class youths' paper, are earnestly requested to assist us in the undertaking, by aiding in its circulation, and calling the attention of their neighbors to the commendable features of our paper. Such favors will be most fully appreciated by the publishers. Send for specimen numbers, which will be furnished free.

DEWEY & CO., Publishers.

San Francisco, Feb. 23d, 1866.

Respect old Age.—Bow low the head, my young friend. Do reverence to the old man.

He was once young and fair like you; but the vicissitudes of life have silvered the hair, and changed the round, merry face to the worn visage before you.

Once that heart beat with incidents co-equal to any you have ever felt; but his aspirations have been crushed by disappointment, as yours may possibly be.

Once that form moved proudly through the gay scenes of life; now the hand of Time that withers the flowers of yesterday has warped the figure and destroyed the noble carriage.

Once, at your age, he possessed the thoughts that pass through your brain; now wishing to accomplish deeds worthy of a nook in fame; anon imagining life a dream, that the sooner awoke from the better. The time to awake is very near at hand, yet his eye kindles at noble deeds of daring, and the hand makes a firmer grasp of the staff.

Bow low the head, my young friend, as you, in your old age, would be reverenced.

Run not after blessings; only walk in the commandments of God, and blessings shall run after you, pursue and overtake you.

Worth Remembering.—The whole use of a hat is probably not generally known—it is of more use than covering the head. If, when a person fell overboard, he had the presence of mind to instantly take off his hat, and hold the him of it to his chin, so that the hollow would be upward, it would keep him above the water as long as he could hold it in that position. This has been tried, and actually found correct.

Anger may glance into the breast of a wise man, but it rests only in the bosom of fools.

City College Laboratories,

Southeast Cor. Stockton and Geary sts.

Practical and Analytical Chemistry and Metallurgy.

THOMAS PRICE,

Professor of Chemistry,

(Formerly of the Normal College, Swansea,)

Will give practical instructions in qualitative and Quantitative Analysis and Assaying. The course qualifies students for the application of Chemistry to METALLURGY, MANUFACTURING ARTS, and MINING PURPOSES.

PHARMACEUTICAL and TECHNICAL CHEMISTRY, such as is required by Medical and Pharmaceutical students, will be taught to such students as may require it.

Course of General Chemistry.

Evening Lectures will be delivered every Tuesday, at half-past seven o'clock, P. M., in the Philosophical Hall of the College, without extra charge to the students in the Institution.

ANNUAL REPORT

—OF THE—

Pacific Insurance Company.

In compliance with the act of the Legislature of the State of California, entitled "An Act concerning Corporations," passed April 22, 1850, the Pacific Insurance Company of San Francisco makes the following Annual Report:

I.—The amount of the Capital Stock of this Company is SEVEN HUNDRED AND FIFTY THOUSAND DOLLARS, and paid in GOLD..... $750,000

II.—The amount of the Assets is ONE MILLION AND FIFTY-ONE THOUSAND, FOUR HUNDRED AND TWENTY DOLLARS AND THIRTY-SEVEN CENTS..$1,051,420.37

III.—The Company has NO DEBTS

IV.—The amount of insurance effected during the year, and which remained in force December 31, 1865:

Fire..... $12,973,949
Marine..... 481,408

This Company commenced underwriting Marine Risks, August 1, 1851.

V.—This Company insures against the following risks, viz: BUILDINGS, HOUSEHOLD FURNITURE, MERCHANDISE, RENTS, LEASEHOLDS, VESSELS IN PORT AND THEIR CARGOES, and other PERSONAL PROPERTY, AGAINST LOSS OR DAMAGE BY FIRE.

Also, on CARGOES, TREASURE, COMMISSIONS, PROFITS, and WAR RISKS, and ON ALL MARINE AND INLAND NAVIGATION RISKS, TO AND FROM ALL PORTS IN THE WORLD.

VI.—This Company will take on any FIRST-CLASS RISK not to exceed $75,000 (the limit fixed by law), and on all large risks will reinsure to an extent consistent with PRUDENCE in other RESPONSIBLE COMPANIES.

J. HUNT, President.
A. J. RALSTON, Secretary.

1852. 1866

A NEW VOLUME.

Fourteenth Year of Publication.

THE GOLDEN ERA.

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, The Golden Era is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents and contributors of distinguished ability in New York, Paris and London.

Miss BRADDON'S Greatest Sensation Story published from Advance Sheets:

RUPERT GODWIN;

—OR—

The Secret of Wilmindon Hall.

A NOVEL.

By Miss M. E. Braddon,

Author of "Lady Audley's Secret," "The Outcasts," "The Doctor's Wife," "Three Times Dead," etc.,

—IN—

THE GOLDEN ERA.

NOW IS THE TIME TO SUBSCRIBE!

The Golden Era is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render The Golden Era a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome The Golden Era as a regular weekly visitor.

Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the Golden Era, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the contributors to the Golden Era are all the prominent writers of Literary Repute in California and on the Pacific Coast, also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

"THOUGHTS AND THINGS"

APPEAR WEEKLY IN THE GOLDEN ERA.

Read "Thoughts and Things" in the Golden Era.
" "Professor Clearquill." in the Golden Era.
" "Dogberry," in the Golden Era.
" "Alice Mason," in the Golden Era.
" "Hugh Humphrey," in the Golden Era.
" "Bill Dadd," in the Golden Era.

Five copies, one year.....$18 00
Ten copies, one year.....$35 00

Now is the Time to Subscribe.

TO ADVERTISERS.

Best Advertising Medium.—The Golden Era is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village and mining and agricultural precinct in California, and offers unusual and unequalled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

BROOKS & LAWRENCE,

Golden Era Building,
No. 543 Clay street, near Montgomery, San Francisco

LITTLE DEEDS OF KINDNESS.—Each of a thousand acts of love costs very little of itself, and yet when viewed together, who can estimate their value? The child whose good offices are always ready when wanted—to run up stairs or down—to get chips, or rock the cradle—to run on an errand and right back—all with a cheerful look and a pleasant temper, has a reward along with such good duties. If a little girl cannot take her grandfather on her lap as he takes her on his, she can get the slippers, or put away his book, or gently comb his thin locks; and whether she thinks of it or not, these little kindness that come from a loving heart, are the sunbeams that lighten up a dark and woful world.

If you are naturally disposed to anger, frequent the company of the patient; by this means, and without any labor you will attain a becoming temper.

New Mining Advertisements.

Continued Mining Advertisements will be found under another head

Comet Petroleum Company, Mattole District, Humboldt County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 22d day of January, 1866, an assessment (No. 2) of thirty (30) cents per share was levied upon the capital stock of said Company, payable on the 23d day of January, 1866, in gold coin of the United States of America, to the Secretary, at the office of the Company, No. 36 Exchange Building, Montgomery street, in the city of San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 31st day of March, 1866, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 14th day of April, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

L. CROSBY, Secretary.

And in accordance with law, and an order of the Board of Trustees, made on the 5th day of January, 1866, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Olney & Co., at the office of the Company, Room No. 15, Government House, San Francisco, Cal., on the 3d day of March, 1866, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

feb17 JOHN S. MACKENZIE, Secretary.

THE PRESS is a large, sixteen-page paper, and is truly a valuable assistant to the mining interests of the Pacific Coast.—[Nye County News.

Keokuk Gold, Silver and Copper Mining Company, Clayton District, Contra Costa County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 14th day of February, 1866, an assessment of ten (10) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Saturday, the 17th day of March, 1866, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 31st day of March, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

A. B. WINEGAR, Secretary.

Office, 308 and 310 Front Street, San Francisco. feb17

George Washington Gold and Silver Mining Company, Silver Mountain District, Alpine County, Cal.

Assessment No. 10.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 20th day of February, 1866, an assessment of one dollar and fifty cents ($1.50) per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, only.

Any stock upon which said assessment shall remain unpaid on Saturday, the 24th day of March, 1866, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Tuesday, the 10th day of April, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

W. D. ROOT, Secretary.

Office, 338 Montgomery street, San Francisco.

NOTICE.—By an order of the Board of Trustees, made in the above Company, all the Certificates of Shares outstanding of the old stock are annulled, and have been replaced by issues of Certificates of the new stock, and parties are cautioned against purchasing any of the old Certificates, as they are all cancelled on the books of the Company, and all transfer of the same stopped.

feb24 W. D. ROOT,

Providence Gold and Silver Mining Company, Nevada District, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 5th day of February, 1866, an assessment of one ($1) dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Saturday, the 17th day of March, 1866, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 31st day of March, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, No. 10 Government House, corner of Sansome and Washington streets, San Francisco. feb10

Southern Light Gold and Silver Mining Company, Reese River Mining District, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 6th day of February, 1866, an assessment (No. 8) of twelve dollars and fifty cents ($12.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold or silver coin, to the Secretary, at his office, No. 228 Front street, San Francisco, Cal.

Any stock upon which said assessments shall remain unpaid on Saturday, the 10th day of March, 1866, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 26th day of March, 1866, at 3 o'clock, P. M., to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

E. J. DRINKHOUSE, Secretary.

Office, No. 228 Front street, San Francisco, Cal. feb10-4w

United States Mining Company.—Location: Virginia District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 7th day of February, 1866, an assessment of fifty (50) cents per share was levied on each and every share of the capital stock of said company, payable immediately, in gold or silver coin of the United States, to the Secretary, at his office, or to F. A. Marston, Virginia, Nevada.

Any stock upon which said assessment shall remain unpaid on Saturday, the 17th day of March, 1866, will be advertised as delinquent, and unless paid, will be sold on Saturday, the 31st day of March, 1866, to pay said delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, No. 10 Government House, corner Sansome and Washington streets, San Francisco. feb10

Walipi Gold, and Silver Mining Company, Moss Lode, San Francisco Mining District, Arizona Territory.

Notice is hereby given, that the Annual Meeting of the stockholders of the Walipi Gold and Silver Mining Company, will be held at the office of the Company, No. 620 Washington Street, San Francisco, ON WEDNESDAY, March 21, 1866, at 12 o'clock M. Trustees will be elected, and other important business transacted.

feb24-4w H. B. CONGDON, Secretary.

DEWEY & CO.,
Patent Agents, Publishers and Job Printers, 505 Clay st

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alterations which they may desire made in their advertisements at their earliest convenience. New advertisements should be sent in as early as possible.

KIND HEARTEDNESS TO CHILDREN.—Blessed be the hand that prepares a pleasure for a child, for there is no saying when and where it may again bloom forth. Does not almost everybody remember some kind-hearted man who showed him a kindness in the happy days of his childhood? The writer of this recollects, when a bare-footed lad, he stood at the wooden fence of a little garden, in his native village, while with longing eyes he gazed on the flowers which were blooming there in the brightness of a Sunday morning. Their owner came forth from his little cottage. He was a wood-cutter, and spent the whole week at work in the woods. He had come into the garden to gather flowers to place in the button-hole of his coat when he went to church. He saw the boy, and, breaking off the most beautiful of his carnations, he gave it to him. Neither the giver nor the receiver spoke a word, and with bounding steps the boy ran home. And now here, at a vast distance from that home, after so many years, the feeling of gratitude which agitated the breast of that boy expresses itself on paper. The carnation has long since withered, but it now blooms afresh.

THE RISING GENERATION.—In the United States there are about 60,000 common schools, which are supported in part by the State Treasuary, and partly by school funds and school taxes. In England and Wales there are 46,042 public and private schools, attended by 2,144,378 scholars. In addition, there are 1,545 evening schools, which provide for 30,783 children. The number of Sunday Schools is 23,514, with 2,407,642 scholars. It is estimated that in England there is a scholar for every 835 persons; in Scotland about one-seventh of the people are at school; while in the United States there is one scholar for every five persons. In Russia only one child for about 200 persons receives instruction in school, so that while at 9 o'clock on every Monday morning there are 4,000,000 American boys and girls at school, there are in Russia only 100,000 enjoying the benefit of instruction.

A Clergyman in Chicago, last Christmas morning, missed his stockings, and after a long search found one on each horn of a new milch cow, which had been presented to him by his parishoners, and ornamented in this way to indicate that it was a Christmas gift.

J. B. CONE, BUSINESS AGENCY.—Makes private sales of Property and Business Places of every description, in the city and throughout the State; procures partners with large and small amounts of money; negotiates sales o mining property, and does a General Agency Business. Patronage solicited by mail, express, or by personal application at the office, 402 Montgomery Street, San Francisco, California. 23v11tf

FOR SALE.

Owing to the great distance from our point of manufacture, we offer for sale the State Right of California for our

Patent Boring Tools for Artesian Wells,

illustrated upon the first page of this paper February 17th. These Tools are now in use in the various Oil Regions of Pennsylvania, Ohio and Virginia; and although but just introduced, are universally approved and admired, and bid fair to become eventually the most popular tools in use. We shall close without reserve to the party sending us the highest bid, to whom we will mail a complete set of Drawings, copy of Circulars, etc.

Address, fully,

A. A. WILSON,
Morgan Iron Works,
7v12tf Foot 9th street, East River, New York City.

GEORGE E. BROWN,

(Late Assistant Examiner in the U. S. Patent Office,)

HAVING RESIGNED THAT POSITION AFTER A TENure of office of eighteen months, offers his services to

INVENTORS AND THEIR ASSIGNEES,

—AS A—

Patent Solicitor,

He will make Preliminary Examinations in the Patent Office, with a view to ascertain the Patentability of any invention that may be submitted to him for that purpose; will prepare the necessary papers for those who wish to make Applications for

Patents for their Inventions,

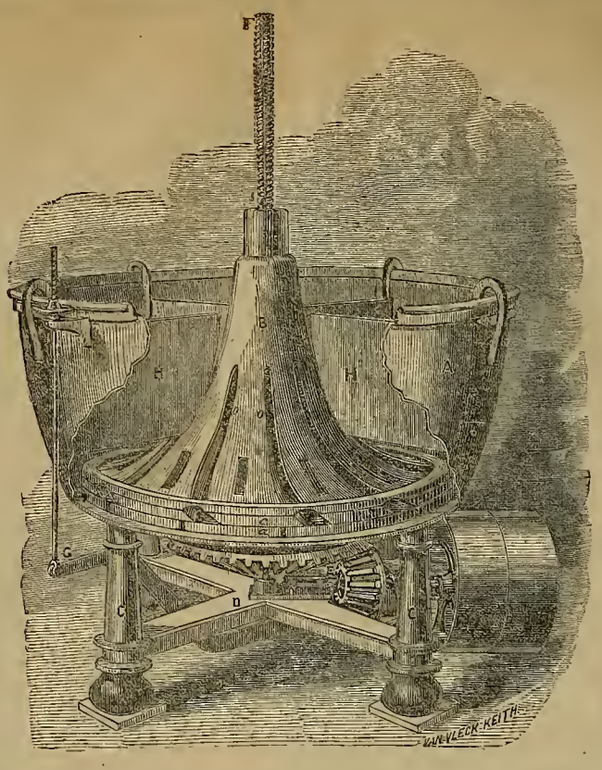
—OR FOR—

EXTENSIONS OR REISSUES OF PATENTS

Already granted; will act as an Attorney in presenting Applications at the Patent Office, and in managing them to a final issue; will draw up Assignments; will examine into the condition of Rejected Applications when desired to do so, and undertake the prosecution of such as may be considered patentable, and do whatever else is usually done by Patent Solicitors.

Address, P. O. Box **257**, Washington, D. C. 7v12-3m

MONEY BY MAIL.—Subscribers and advertisers remitting us money in less sums than $50, can do so by mail at our risk, if they will register their letters; we will take no risk on unregistered letters, or letters by express. Remittances by express must be prepaid.



THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and *o*, Openings,

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works.

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

OIL WELL BORING.

J. SEVENOAKS,
Contractor

For Well Boring and Erecting all kinds of Machinery connected therewith.

Having had extensive experience in boring for oil in Pennsylvania, Canada and elsewhere, I feel confident of being able to give entire satisfaction. Persons desirous of making contracts as above, or wishing information with regard to oil indications, etc., will please address me at the office of the "Mining and Scientific Press," San Francisco, or to my personal address, Box 1229 San Francisco. 2v11

MINING PROPERTIES.

PARTIES WISHING MINING PROPERTIES CAN BE accommodated by applying to the Pacific Mineral Co., 434 California Street, next door east of the Pacific Insurance office, up stairs. W. F. BRYANT, Agent.

N. B.—Parties forwarding Mining interests for disposal, are reminded that it is important to state such facts only as can be fully substantiated, upon a careful examination of said properties, thereby greatly enhancing the chances of success, and avoiding the useless loss of time and trouble. 1v12

BY EXPRESS.—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co.'s tariff) on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must themselves settle the same.

HOME!—Who is not charmed with the music of that lovely word? Who has not felt the potent spell of magic that lingers around it, than which no term in the English language is more replete with delightful associations? It matters not where it is—whether under a scorching tropical sun, or far away among the icy regions of the north; whether on the mountain or in the valley; whether in the city or in the country, it still is home. It consists neither of house; nor of furniture; nor of gold. Material things that perish and change, may sometimes add interest to home; but they never constitute its essence. It is not essential to the happy home that it should contain the luxuries of carpeted floors and elegant furniture. Such things only dazzle the eye; they never touch the heart. Cheerful hearts and loving acts, combined with neatness and order, are the things that make home happy. As a general rule, there is infinitely more true happiness to be found at the cottage fireside, than in the splendid saloons of the wealthy. Still, the luxuries and elegancies of life are not to be despised. When thankfully received and properly employed, they add vastly to our happiness. It is the *use* we make of our riches which gives us true enjoyment—not their possession.

As a writer has most beautifully said: "The happiness of life, the happiness of the family, especially, is made up of minute fructions; the little soon-forgotten charities of a kiss, a smile, a kind look, a gentle word, a heartfelt compliment—these, and the thousand other little kindnesses of genial feelings make a perpetual summer in the household where they prevail. And if there be a spot on earth which an els might long to visit, and where they might fondly linger, it is the loving christian family, where parents and children, board together in the blessed compact of love, and moving in harmonious spheres of duty and affection, fulfil the holy and beautiful purposes of the Family Institution."

THERE are no less than thirty-seven rebellions recorded in English history between the time of William the Conqueror, A. D. 1069, and the Irish outbreak in 1803. Several others have since occurred. The British foreign wars have been incessant, and their expenses have been enormous. That of the American Revolution was six hundred and thirty million dollars, and the contest with the first Napoleon cost five thousand seven hundred and ninety-five million.

No one will consider the day is ended, until the duties it brings have been discharged.

BY MAIL.—The MINING AND SCIENTIFIC PRESS will be sent by mail to any part of the civilized world. In case of removal, subscribers have only to inform us of the post-office address of their old and new location, and the paper will be sent accordingly.

San Francisco, April 10th, 1865,

Machinery.

HUNTER'S
PREMIUM
CONCENTRATOR, AMALGAMATOR
AND SEPARATOR,

Awarded a Silver Medal at the late Mechanics' Fair.

HUNTER'S CONCENTRATOR CAN BE SEEN IN OPERation daily at the Novelty Iron Works, Fremont street. Parties wishing to purchase Concentrators will find it to their advantage to examine the above machine before purchasing elsewhere, for the following reasons:

1st. It will work the sands from a 5-stamp battery, and save from 10 to 20 per cent. more sulphurets than any machine built on the Pacific coast.

2d. The Sulphurets are washed clean, containing less than ten per cent. of sand.

3d. The waste free gold and amalgam is amalgamated on the copper plates; not a particle of ground mercury and scarcely a trace of metal passes off with the sand.

4th. Its simplicity is a sufficient recommendation for its general use as a Concentrator. The variation of speed in a Quartz Mill does not effect the working of the Machine. The same was demonstrated at the late Mechanics' Fair, when with the greatest IRREGULARITY OF SPEED the best of results were given.

5th. There is no clogging or stopping to clean out the sulphurets and sand; consequently no waste from any inattention on the part of the attendant.

6th. In exhibiting the working of the machine (it is not run empty), all classes of ores and tailings, from 50 pounds and upwards, are concentrated that parties may see fit to test the machine with.

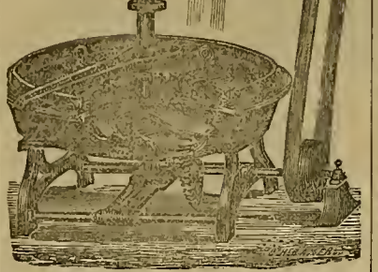
Give it a trial, and satisfaction is guaranteed. All orders and any information required, address,

ANDREW HUNTER,

Novelty Iron Works, Fremont st., San Francisco,

15v11-3m Or to K. T. STEEN, Agent.

BAUX & GUIOD S
Separator & Amalgamator



Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules, among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crail's Gravel Cement Works, Nevada county; Wallman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Heugh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6d1f

BLAKE'S
QUARTZ BREAKER

Is now extensively used for breaking hard masses of

Quartz or Ores

To a size suitable for stamps. These machines are patented, and are in practical operation in

CALIFORNIA, AUSTRALIA,
WASHOE,
ENGLAND, FRANCE,
—AND—
THE ATLANTIC STATES.

These Machines, or circulars containing further information regarding them, may be obtained of the undersigned. Address,

BLAKE & TYLER,

Box 2077 San Francisco Post Office.

CHAS. T. BLAKE, Idaho City. E. TYLER, Michigan Bluff. WM. P. BLAKE, San Francisco.

4v10

Hepburn & Peterson's
AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ The Amalgamator may be seen in operation at the European Metallurgical Works, Bryant St. bet. 3d and 4th. [Illustrated in the Mining and Scientific Press, April 9th, 1864.]

COMBINING THE MAXIMUM OF EFFICIENCY, Durability, and Economy, with the Minimum of weight and Price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.

Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of milling enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist-mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

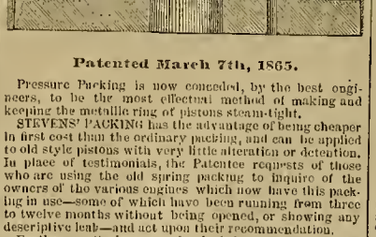
All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Grist Mill's.

For sale by TREADWELL & CO.,

3v12-3m Corner of Front and Market streets.

Stevens' Pressure Packing.



Patented March 7th, 1865.

Pressure Packing is now conceded, by the best engineers, to be the most effectual method of making and keeping the metallic ring of pistons steam-tight.

STEVENS' PACKING has the advantage of being cheaper in first cost than the ordinary packing, and can be applied to old style pistons with very little alteration or detention. In place of testimonials, the Patentee requests of those who are using the old spring packing to inquire of the owners of the various engines which now have this packing in use—some of which have been running from three to twelve months without being opened, or showing any descriptive leak—and act upon their recommendation.

Further particulars can be had by applying to the Patentee, ANDREW STEVENS, Master Mechanic, Alameda Railroad, or at the VULCAN IRON WORKS, where they can be seen, at any time, in course of construction.

10df ANDREW STEVENS.

FOR SALE!
A STEAM ENGINE!

18-INCH CYLINDER, FOUR-FOOT STROKE, IN PERfect Order. Inquire at VULCAN IRON WORKS, 137 and 139 First street, or to

HEYNEMANN & CO.,

WATER WHEELS!

Equal to the Best Overshot Wheel

POWER PLEDGED

IN EXISTENCE.

LEFFEL'S
AMERICAN DOUBLE TURBINE

Is now manufactured by the Vulcan Iron Works Company, in this city, and orders for the same can be filled immediately. We have a large supply of the different sizes, from 10 inches to 30½. That we may know the proper sized Wheel you require, measure your water in the following way: Take the width of the stream, the average depth and the distance it flows in a minute.

All the Wheels already in use give universal satisfaction. For particulars send for a Circular.

This Wheel is especially adapted to mining purposes. It is light, and can be easily packed into the mountains. Wheels weighing from 100 to 300 pounds, will yield from 10 to 40 horse-power under a head of 25 or 30 feet. They are the cheapest wheel to set up known, as they are so arranged as to produce the greatest power possible from the water used.

Come and see them, or send for a Circular to

LEFFEL & MYERS,

At Vulcan Iron Works, office 137 and 139 First street, San Francisco. 4v11tf

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the PACIFIC FOUNDRY,

1v1 San Francisco.

Prater's Patent Concentrator

(Known as HUNCERFORD & PRATER'S Concentrator,)

MANUFACTURED AT THE

San Francisco Foundry and Steam Engine Works.

Corner Fremont and Mission Streets.

All orders promptly attended to.

HUNT'S PATENT
Circular Sweep Horse-Powers,

For running Churns, Washing Machines, Grindstones, pumping water, sawing wood, and other light machinery. Price, $100, at the Factory.

HUNT'S PATENT SELF-REGULATING TREAD HORSE-POWER is superior to any machine of the kind in the market. Price, with Governor, all complete to set to work, at the Factory, $300. Manufactured by

E. O. HUNT,

7v10 28 Second street, San Francisco.

Important to Miners.

NEW PATENT ROASTING PROCESS.

I AM NOW PREPARED TO OFFER TO THE MINING community a New Roasting Process, which has been approved as novel and beneficial by the best authorities in Europe. A Furnace can be erected in a few days at a trifling expense, and one man is able to Roast ten tons of Ore or Concentrated Sulphurets per day,

MORE COMPLETELY AND CHEAPER

Than any other Process. All the Sulphur is saved, by being converted into Bisulphide of Carbon, which is a valuable product, and will pay nearly all expenses.

For particulars, apply to

J. MOSHEIMER,

26v11-3m 423 Washington street.

SALMON'S
PROPELLOR AMALGAMATOR
—AND—
Challenge Settler

Has been in use and thoroughly tested, both in California and Nevada, with entire satisfaction to all parties concerned. These Machines are

Made entirely different from any others,

And with the same power will grind, amalgamate, settle and separate, more gold and silver ore than any others now in use. Manufactured at the SAN FRANCISCO FOUNDRY where Machines can be seen in operation. Address

9v11 J. & W. C. SALMON.

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

A CHOICE ADVERTISING MEDIUM.

This week we issne an edition of 5,000 copies of the Youths' Companion, every copy of which will be thoroughly scanned by more than one pair of sharp little eyes, and the contents of every page, from first to last, will be re-uttered by many active, lively tongues in the presence of over 4,000 of the best families in this city and State.

Although we are receiving many additional subscribers to our list in response to the new enterprise in which we have engaged, we cannot expect, with the present high cost of printing paper, and our very low terms, to receive sufficient money from subscriptions alone to furnish as good a journal as we have determined to publish for our patrons; so we have widened the columns of the paper and adopted smaller type, which admits more letters in each line, and many more lines in each column of the paper, that we may have room for a few more select advertisements in the Companion *without decreasing in the least* any class of reading matter.

Our little journal circulates in more families than any other weekly published in San Francisco. No advertisements of the least objectionable character will be received, and as but a limited space will be devoted to this department, our young friends can safely inform their storekeepers, and other business acquaintances of these important facts for the benefit of the paper and all concerned.

Remember, only a few columns of our regular issue will be devoted to advertising, and the more profitable that class of patronage is made the greater will be the outlay upon our reading columns.

Dewey & Co., Publishers.

February 23d, 1866.

NEW BOOK.

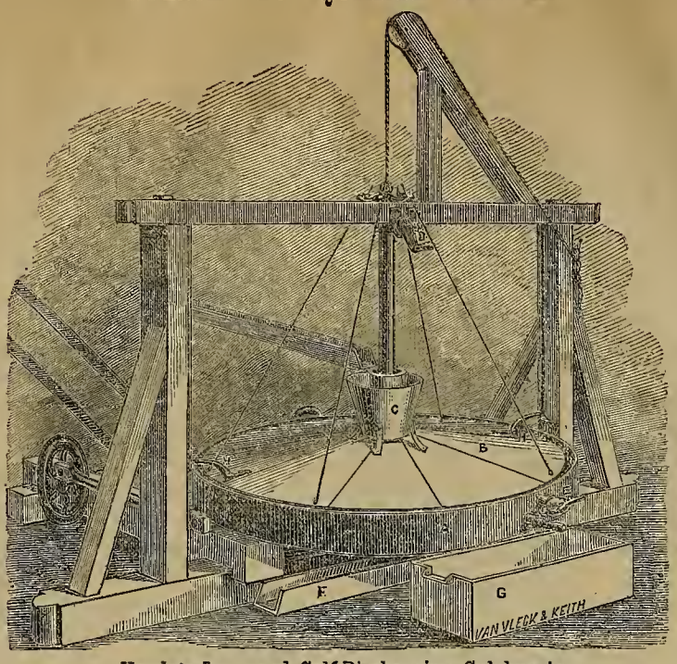
A Manual of Metallurgy, more particularly of the Precious Metals, including the Methods of Assaying them: By George Hogarth Makius, M. R. C. S., F. C. S., one of the Assayers of the Bank of England; Assayer to the Anglo-American Mints, and Lecturer upon Metallurgy at the Dental Hospital, London. Illustrated with fifty engravings.

We are indebted to Roman & Co., for a copy of the above "Manual of Metallurgy," a work designed more particularly for persons just commencing their acquaintance with the minerals and their metals. In addition to the strictly original matter contained in the work, the author has collected and arranged upon its pages, and brought together in the smallest practical space a large amount of information, which cannot fail of being of great service to the student whose avocations leave him but little time for extended reading upon such matters as are here treated upon. It is a work which should find a place in the library of every miner and millman in the State. We shall endeavor to allude to it more fully next week.

The Ione Company, at Grass Valley are taking out some very rich rock, and are developing their mine with a most commendable degree of energy. They have erected a ten-stamp mill, and as soon as lumber can be had, will add ten more stamps. The mine is easily worked, and is expected soon to repay its energetic proprietors for their outlay. The contractor and builder of the present mill is a young and promising mechanic, as the skill and energy displayed in its construction fully testifies. Only six weeks previous, the timber, which has now been constructed into a large building and mill, was growing in the forest; which, considering the state of the weather and roads, is of itself a feat worthy of the highest commendation.

The Blue Ledge, El Dorado County.—This Company's mill lately cleaned up a run of sixty tons of ore, obtaining thirty-one ounces of gold. This is the first crushing under the Company's new superintendent, Mr. A. M. Stetson. A large portion of the rock crushed was from the old heap, from which but little return was expected. We are informed that the company is now taking out very good rock, and such as will yield a much larger average than the above, although even that yield can be made to pay with the facilities which the company now possess for mining and milling. The Superintendent writes that he is now getting out rock in sufficient quantities to keep a 20-stamp mill running.

NOTICE TO QUARTZ MINERS.



Hendy's Improved Self-Discharging Sulphurets

PRATER CONCENTRATOR

Is Receiving Universal Favor.

Reference is made to the following Mills which are using the Prater Concentrator, with some of the improvements attached. The Self-Discharging Sulphurets has been more recently adapted, and the public attention is called to examine its workings:

STEPHENS' MILL, Humboldt County, Nevada.
CHRYSOPOLIS MILL, " "
U. S. REESE RIVER MILL, Austin, " "
CARROL & ASPINWALL MILL, Reese River, Nevada.
UNION MILL, El Dorado County, near Mud Springs.
NEW YORK AND EL DORADO CO., " "
BLUE LEDGE MILL, near Spanish Flat, El Dorado Co.
CONEY MILL, Jackson, Amador County.
Messrs. TUBBS & CO'S MILL, San Andreas, Amador Co.
WINTER'S MILL, Angels Camp, Calaveras County.
CLIO MILL, Jacksonville, Tuolumne County.

And in use in other parts of this State; also in Idaho, Arizona, Colorado and Mexico.

As a further evidence of its worth, two of these Concentrators were ordered recently by Messrs. Goddard & Co., of this city, for their Mill (Independence Mill), near Sonora, Tuolumne County, which are now being fitted up at the Pacific Foundry. The parties have extensive experience in quartz machinery, and have concluded to use these Concentrators in preference to all others.

A further order for a Concentrator from Messrs. Bigelow & Bro., of this city, who are now using two Concentrators at the Coney Mill, Jackson, Amador County.

They may be seen in operation at the GOLDEN STATE FOUNDRY, No. 19 First Street, San Francisco.

☞For explanation of the above engraving, and other particulars, send for a Circular.

JOSHUA HENDY,
No. 402 Montgomery street, Room 3, 4th floor.

A Condensed History of Steam.—About 280 years B. C. Hero of Alexandria formed a toy which exhibited some of the powers of steam and was moved by its power.

A. D. 540, Anthemius, an architect, arranged several cauldrons of water, each covered with the wide bottom of a leathern tube, which rose to a narrow top with pipes extended to the rafters of the adjoining building. A fire was kindled beneath the cauldrons, and the house was shaken by the efforts of the steam ascending the tubes. This is the first notice of the power of steam recorded.

In 1543, June 17, Blasco DeGaroy tried a steamboat of 209 tons with tolerable success at Barcelona, Spain. It consisted of a cauldron of boiling water and a moveable wheel on each side of the ship. It was laid aside as impracticable. A present, however, was made to Garoy.

In 1650, the first railroad was constructed at Newcastle-on-Tyne.

The first idea of a steam engine in England was in the Marquis of Worcester's "History of Invention," A. D. 1663.

In 1710 Mewcomer made the first steam engine in England.

In 1718 patents were granted to Savary for the first application of the steam engine.

In 1764 James Watt made the first perfect steam engine in England.

In 1736 Jonathan Hulls first set forth the idea of steam navigation.

In 1778 Thomas Paine first proposed the application in America.

In 1781 Marquis Jouffroy constructed a steamboat on the Saone.

In 1785 two Americans published a work on it.

In 1789 William Tymington made a voyage in one on the Forth and Clyde Canal.

In 1802 this experiment was repeated.

In 1782 Ramsey propelled a boat by steam at New York.

In 1787 John Fitch, of Connecticut, navigated a boat by a steam engine on the Delaware.

In 1793 Robert Fulton first began to apply his attention to steam.

In 1793 Oliver Evans, a native of Philadelphia, constructed a locomotive steam engine to travel on a turnpike road.

The first steam vessel that ever crossed the Atlantic was the Savannah, in the month of June, 1819, from Charleston to Liverpool.

Our Circulation.—The Mining and Scientific Press has a large and permanent subscription list, and enjoys a more universal circulation among stockholders and persons directly interested in mining than any other paper on this coast.

The Moss Lead.—We mentioned, some weeks since, the departure of a party of miners under charge of Mr. C. D. Strong, the former superintendent of the Gould & Curry mine, to work the famous Moss lead, in Arizona. The company have been advised of the arrival of the party on the ground and the commencement of operations. They are all in good health and spirits, and pushing ahead finely with the work of development. This enterprise will soon lead to the development of other mines in that locality, the existence of a number of which is already known.

Pacific Mail Steamship Co.

The following Steamships will be dispatched on the following named days.

March 10th—SACRAMENTO.....Capt. J. M. Cavarly, Connecting with COSTA RICA, Capt. Maury.

March 19th—GOLDEN AGE.....Capt. E. L. Farnsworth. Connecting with NEW YORK, Capt. Horner.

March 30th—CONSTITUTION.....Capt. F. R. Baby, Connecting with HENRY CHAUNCEY, Capt. Gray.

From Folsom street Wharf

At 11 o'clock A. M., punctually to the hour,

For Panama.

Passengers will be conveyed from Panama to Aspinwall by the Panama Railroad Company, and from Aspinwall to New York in the splendid steamships of the PACIFIC MAIL STEAMSHIP COMPANY.

Steamers of this line will be dispatched the 10th, 19th and 30th of each month. When these dates fall on Sunday, the steamer will leave on Saturday preceding.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departure of 19th connects with French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America.

Departure of 10th connects with English steamer for Southampton, and steamer running to Guayaquil, touching at Tumaco, the port of the new mines, and P. R. R. Co.'s steamer for Central America.

Cabin passengers will be berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

For merchandise freight apply to Wells, Fargo & Co.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

MECHANICS' INSTITUTE ELECTION.

The annual election of the Mechanics' Institute, last Monday, proved quite a spirited affair, and resulted in the choice of equal numbers on the regular and opposition tickets. The president elect, Mr. H J. Booth, is a thorough mechanic and business man, being one of the most prominent and successful foundrymen in this city or State. Although Mr. Booth lost some votes through his reported opposition to the eight hour law, the election was by no means generally influenced by that question.

The votes cast were very much scratched, the hardest contested offices being for president, vice president, and treasurer. Following is the vote:

Regular Nominations.		*Opposition Nominations.*	
FOR PRESIDENT.			
H. J. Booth	*314	Charles M. Plum	292
FOR VICE PRESIDENT.			
D. A. Macdonald	*333	A. C. Austin	272
FOR RECORDING SECRETARY.			
Robert Riddle	284	Jason B. Pierce	*327
FOR CORRESPONDING SECRETARY.			
A. S. Hallidie	276	A. T. Dewey	*327
FOR TREASURER.			
Edward Nunan	262	Thomas Young	*349
FOR DIRECTORS.			
James B. Johnson	501	Joseph McGill	*313
P. J. O'Connor	284	N. W. Spaulding	*475
Henry Webb	*314	W. W. Hanscom	284
John W. Farren	*323	Chas. Elliott	277
F. G. Edwards	173	R. S. Eels	275
James Spiers	*305	Hiram Rosekrans	*229
Wm. T. Garratt	*336	W. C. Pease	296

*Elected.

The election brought in about 225 new members, each of whom paid an admission fee of $5, and one quarter's dues in advance, $1.50. By the receipts from this source, and from payment of back dues, the Institute must have realized some $1,600.

Although a rush of new members into any association for the purpose of voting is a most doubtful acquisition, we are glad to note that many excellent names appear in the list of those who joined the Institute on Monday.

On Thursday evening a special meeting of the Institute was held, and the new officers duly installed. The president made a brief and appropriate speech, alluding to the present influence of the society, and evincing an earnest determination to advance its best interests. A committee was appointed to report resolutions at the next meeting, complimenting the past officers for their able and faithful services.

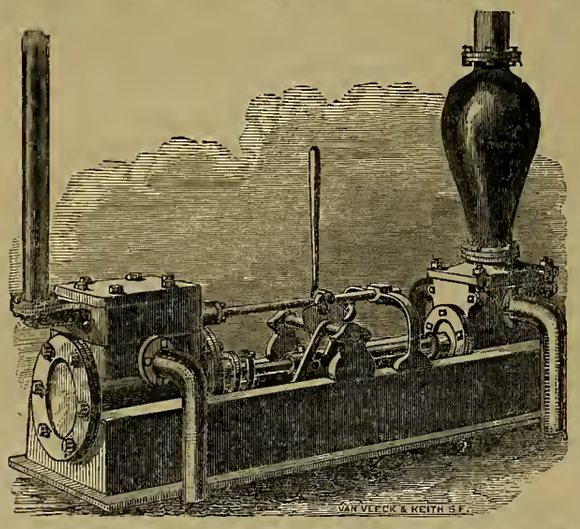
Our evening cotemporary, the *Bulletin*, gives the following approbative paragraph:

"The new officers elect are all able and energetic men, and the Institute cannot fail to thrive under their management. It is also due to the retiring officers to say, that their management of the affairs of the Institute during the past year has been eminently wise and judicious, and that in no year since the foundation of the Mechanics' Institute has it been more prosperous than under their administration."

HANSBROW'S DOUBLE ACTING, HORIZONTAL PUMPING ENGINE.

Any substantial improvement in machinery for pumping in mines must be admitted at this time to be of great importance. The engraving connected with this article represents a new style of pumping engines, just completed at the Miners' Foundry, in this city, for Hon. Thomas Hansbrow, of Sacramento, the ingenious inventor of the world-renowned challenge pump. We copy the following description from the annual circular of the Miners' Foundry, now in press in the MINING AND SCIENTIFIC PRESS book and job printing office.

This engine is applicable for feeding boilers, irrigation, and mining purposes, and can be



HANSBROW'S DOUBLE ACTING, HORIZONTAL, HIGH PRESSURE, PUMPING ENGINE.

used as a steam fire engine, as it possesses great forcing power, and can be readily mounted upon wheels. The steam cylinder, which will be seen upon the left of the engraving, is 10-inch diameter; the water cylinder, upon the right, is 6-inch diameter; length of stroke 10-inch; diameter of suction and discharge pipe, each 4 inches; capacity of the pump 10,000 gallons per hour; weight 2,200 pounds; price $950.

The pump valves are of the same construction as those of Hansbrow's other celebrated patent pumps. The power is communicated directly from the steam cylinder to the pump by means of the piston rod, on one end of which is the steam piston, and on the other end the piston of the pump. There is no crank, shaft or fly-wheel, and the valve receives its motion from the piston rod by a very simple arrangement of rock-lever and tappets.

The steam cylinder, pump cylinder and bed plate, form one casting, thereby making it extremely simple, not liable to get out of order, and most substantial in its construction. It requires but little foundation, needs no setting, and can be secured to any beam or planking by screws supplied for the purpose.

BIG BEND.—There is just now quite a rush for the Big Bend mines. There will soon be a big rush back again. The Big Bend will be apt to prove a big break to many a poor miner.

THE NATIONAL LINCOLN MONUMENT.—The State Superintendent of Public Instruction has caused a number of blank books to be prepared, and placed in the hands of the teachers of the public schools, for the enrollment of the names of such pupils and teachers as may feel able and disposed to contribute toward the National Lincoln Monument Fund. It is desired to make this subscription as general as possible. A thousand dollars from 10,000 children, at ten cents each, would be much more acceptable than the same amount from one hundred people who might subscribe one dollar each. The object is not so much the amount which may be raised, as to have all the pupils take an interest in this national work of rearing a monument to a great and good man who has fallen in behalf of a country he loved, and by which he was beloved. Every pupil who subscribes will have his name enrolled as a contributor. The books which have been sent to the different schools, will be forwarded to the State Superintendent, and by him be sent to the National Committee, who will cause them to be deposited in the archives of the Association, when the names of the California schoolchildren and all other contributors to the Fund will be sacredly preserved to all future time.

DEPARTURE.—John Arthur Phillips, Esq., the eminent English Metallurgist, leaves California on the steamer of to-day. We understand that he proposes to embody the results of his observations on this coast in a book, which will be published soon after his return home. We bespeak a large edition for California.

A FLORAL MONSTROSITY.—There has been on exhibition the past week at Keith's drug store, on Montgomery street, a floral monstrosity in the shape of a triple Egyptian lily, or rather three lilies growing from a single stem like the trefoil. It was grown in a garden in this city.

TREASURE FROM SHASTA.—The treasure shipments from Shasta for the month of February, were $98,589.

THE LINCOLN SCHOOL LIBRARY.—It will be recollected that the Lincoln School boys recently gave a public exhibition from which they realized about $800 for the purchasing of additional books for the library connected with that School. We learn from Mr. Hoitt, the Principal, that about half the money has been expended in this city. The books so obtained are already in the school building, and the teachers met a few evenings since for the purpose of putting good substantial covers on them. The balance of the money has been placed in the hands of Roman & Co., for the purchase, in New York, of such books as cannot be obtained here. The selections will be made with the greatest care by a competent person. Cases will soon be made so that the books can be put in position for use by the pupils. We understand the library already contains the best lot of books for teacher's reference to be found in this city.

SCHOOL VACATION.—There will be a vacation of the Public Schools of this city for one week, commencing with Monday next. It was stated at the meeting of the Board of Education, on Tuesday evening last, that there was only about $15,000 in the School Fund. If that is so—and it very probably is—it is to be hoped that the Legislature will take such action the coming week as to secure the continuance of the schools without any other interruption than the proposed vacation of six days. To accomplish this the Legislature may either authorize the issuance of bonds, or they may pass a special act allowing demands for service this year to be paid out of next year's funds. Either will accomplish the purpose; and either course may very properly be produced. At all events we trust the Legislature will take such steps as will enable the Board of Education to keep the schools along without interruption.

THE SPRING VALLEY SCHOOL.—Mr. and Mrs. Marks, Miss Morton and Miss Van Reynegan were transferred to the new Spring Valley School by the action of the Board of Education on Tuesday evening last. It will be recollected that that new, commodious and well planned house recently constructed for this school, at the corner of Broadway and Larkin streets, was dedicated a short time since. A large number of the friends of the school were in attendance, and we are glad to be able to say that a handsome sum was realized for the benefit of the school. The money will be expended in scientific apparatus for the same.

APPOINTED.—Mr. Charles Bonner, formerly Superintendent of the Gould & Curry, has been appointed Superintendent of the Savage, and took charge of the works on Tuesday last. Mr. Bonner is well acquainted with the Comstock lead, and being also quite familiar with the Savage claim, a better man could not have been found to succeed Captain Curtis.

NOT BAD.—Bullion to the value of $475,491.63 was shipped from the office of Wells, Fargo & Co. Gold Hill, Nev., during the month of February.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

THE TRACTORY CURVE, AND THE PROPERTIES OF GRINDING PLATES.

BY W. A. GOODYEAR.

[CONTINUED FROM PAGE 130.]

Let us now look at some of the points relating to the wear and grinding effect of certain plates as investigated in the Hand Book.

I adopt the two *definitions* given under "Laws of Grinding," 1 and 2, page 102. Instead, however, of taking, without modification, the law given under 3, as it is there expressed, I will modify its statement as follows:

The *wear* (that is, the thickness of the layer of material worn from the surface) in *any* direction, at any point of grinding surfaces of uniform hardness, is proportional to the product of the pressure at that point in the given direction, into the distance passed over, *provided* that the surfaces be of such a form that, this law holding true, *the plates can follow each other and remain in contact as they wear away;* otherwise the law does not hold.

I will now discuss, to some extent, the proposition attempted to be proved upon page 103 of the Hand Book.

If I understand the author correctly, it is there assumed that in tractory conoidal plates, of uniform hardness, the *pressure* in the direction of the normal to the surface is constant (which is true *when the upper plate revolves*), and that, *therefore*, the grinding surface will wear into one, whose meridian curve is so related in form and position to the meridian curve of the original surface (that is, the tractory), that the distance intercepted between the two curves, on the normal to the tractory at the point x, y, shall be proportional to the ordinate y (which is *not* true), and it is then attempted to prove that the distance intercepted between these two curves, on a straight line *parallel to the axis of* x, is constant, and, therefore, that the secondary curve is a tractory equal to the first.

(I still use x and y in the same sense as heretofore, viz., as representing the coördinates of points in the tractory when the origin is at F, in the figure on page 103 of the Hand Book.)

I will now show that if the distance intercepted between a tractory and a secondary curve, on the normal to the tractory at the point x, y, be proportional to the ordinate y of the tractory, then the secondary curve is *not* a tractory, and therefore that the distance intercepted between the two curves, on a line parallel to the axis of x, is *not* constant; for if it were the curve would be a tractory.

Consider a point x, y, of the tractory. If X and Y be the running coördinates of the normal at this point, then the equation of the normal is

(51) $Y - y = -\frac{dx}{dy}(X - x)$. This normal will cut the secondary curve in a point x', y', whose coördinates must, therefore, satisfy (51). Hence,

(52) $y' - y = -\frac{dx}{dy}(x' - x)$. The distance between the points x, y, and x', y', is $\sqrt{(x'-x)^2 + (y'-y)^2}$. This distance is, by supposition, proportional to the ordinate y; therefore,

(53) $\sqrt{(x'-x)^2 + (y'-y)^2} = by$, where b is constant. Substitute in (52) the known value of $\frac{dx}{dy}$ in terms of y, thus,

(54) $y' - y = \mp \frac{\sqrt{a^2 - y^2}}{y}(x' - x)$.

If, now, between (53), (54), and (18), we eliminate x and y, we shall obtain an equation expressing the relation between x' and y', which is the equation to the secondary curve in question.

The elimination of x and y in this case, however, involves the resolution of an equation of the fourth degree. If, for example, we obtain the value of $(x'-x)$ from (54), and substitute this in (53), we are led to the equation

(55) $b^2y^4 - a^2(b^2-1)y^2 - 2a^2y'y + a^2y'^2 = 0$, an equation of the fourth degree in y, which, if resolved, would give us four complex expressions for as many different values of y.

If, then, from (53) or (54) the values of x corresponding to these values of y were obtained, and these values of x and y substituted in (18), we should obtain the equation of the secondary curve.

I have not resolved equation (55), and have, therefore, not obtained the equation of the secondary curve, as the operations involved would be tedious, and the resulting expressions would be very complex.

The final equation, however, would represent a curve having eight branches—that is, two branches for each branch of the tractory—one lying upon the concave side, and the other upon the convex side of the latter. This is as it should be, since there are two points in the normal at x, y—one on each side of the tractory—which will satisfy the conditions of equations (52) and (53).

Let us now consider a single branch of the tractory and the corresponding pair of branches of the secondary curve, and let us suppose two other tractories described equal and parallel with the first, but beginning at the points $y = a, x = \pm ba$, instead of the point $y = a, x = 0$.

It may easily be shown, geometrically, by constructing the curves under the above conditions (as I have done for the particular case $b = 1$): first, that the branch of the secondary curve lying upon the convex side of the original tractory begins at the point $y = a, x = -ba$, where it is tangent to the tractory which begins at the same point, but that the balance of this branch of the secondary curve, though lying below the line $y = a$, does not coincide with the tractory to which it is tangent, but lies upon the *convex* side of it; second, that the branch of the secondary curve, lying upon the concave side of the original tractory, begins at the point $y = a, x = ba$, but that beginning here, it immediately rises *above* the line $y = a$, forms an unclosed loop or *hook*, and then descending, crosses the line $y = a$, and continues on, lying then *between* the original tractory and the one which begins at the point $y = a, x = ba$, instead of coinciding with the latter.

The construction which I have made then (and which any one else can make at pleasure), shows that at least in the case where $b = 1$, the secondary curve is not is not a tractory. The question now arises, whether for other values of b the case may not be different.

ERRATUM.—Instead of $\times$ in equation (35) read $+$.

[To be Continued.]

THE two kings that rule America—Jo-king and Smo-king.

[Written for the Mining and Scientific Press.]

From Our Regular Correspondent.

EDITORS PRESS: This place, which has been my center of operations for the past two weeks, is a respectably decayed mining town of the olden time, still retaining its name and organization; but whose glory has long since passed away, with the richness of the gulches and river placers, which once made it famous throughout the State and the whole coast. But though I speak of it as decayed, I do not wish to say that business has entirely deserted the place, or that its streets are lined with empty houses like some of the ex-mining towns of the present day. The glory of the ancient placers is still perpetuated, though feebly, by numerous deep shaft claims, and a few hydraulic diggings, which together with its being the county seat of Calaveras county, keep up quite a respectable show of business. It is only *respectably* decayed.

The principal mining now being carried on in this vicinity is deep placer mining; the gold being obtained from deposits of gravel supposed to be the beds of an ancient system of rivers, now covered by deposits of lava and other volcanic *debris*. The most important enterprise of this kind is the "American Shaft," owned by Messrs. Paul, Larnard & Holbrook, located on Chili Gulch, two miles below this place. The channel was struck at a depth of 100 feet, at which depth a large stream of water was tapped which compelled the owners to suspend operations for some time, and was only removed at an expense of over $30,000. When the water was once checked, there was no further trouble, and the mine is now in successful operation, employing upwards of thirty men, and ten stamps for crushing the cement. The hoisting, pumping, and stamping machinery, are all driven by the steam engine. The daily product of the mine is from $150 to $200 per day, yielding a very handsome profit to the owners. The deepest shaft in this section is that on the claim of

SQUIRES & COMPANY,

Which is about 165 feet in depth. The bed of cement gravel in which the gold is found varies from a few inches to four or five feet in depth, averaging about two feet, and pays about ten dollars per ton, by washing in sluices. The width of the channel is uncertain, but is known to be upwards of fifty feet, the rock on which it rests being ordinary slate. Some of these claims are opened by tunnels driven into the sides of the hills, often at great expense. Among those now in progress may be mentioned

THE INDIAN RAVINE TUNNEL,

Which is being driven into Stockton Ridge, about three miles below Mokelumne Hill, by Messrs. Paul & Haerschner, and other citizens of this town. It is estimated that to reach the channel a rim of slate 1,100 feet in thickness will have to be penetrated. The work has been going on nearly two years, and the tunnel is now in 430 feet, the rock having been very hard thus far. It is estimated that it can be finished in two years more, as the slate is expected to be softer, as the work progresses. There are a few hydraulic claims also at work and many of them are doing quite well, one of these, that of Messrs. Shaw & Co., is immensely rich. It is situated on the west side of Chili Gulch, about a mile and a half below Mokelumne Hill.

THE "OPAL CLAIMS" OF STOCKTON HILL.

Considerable excitement has been awakened at different times by the discovery on Stockton Hill, near this place, of some beautiful concretions, believed at the time to be opals, but which subsequent observations have proved to be agates, some of which are of marvelous beauty, and doubtless of considerable value, though there is no market for them in this country. A company was finally organized among the French residents of Mokelumne Hill and vicinity, and the search commenced in an earnest and systematic manner. The work is done by a Mr. Neven, who showed me the excavations, and explained the different processes employed. The claim of the company is known as the *Occulis Mundi*, (light of the world), and is 5,000 feet in extent along the northern slope of Stockton Hill, and extends to the top of the same. Several tunnels have been driven at different points along the hill side, the longest of which is in 150 feet. The stones are found in a ledge of grayish colored gravel or clay, from three to six inches in thickness, having a slight inclination to the northwest, of about two degrees from a horizontal plane. Each stone is encased in a brittle white substance, supposed by Mr. Neven and others to be produced by the decomposition of the stone itself by the action of chemical agents contained in the water in the hill. Throughout the whole extent of the claim the same regular formation exists, the line of the strata being easily traced, and perfectly straight and parallel. Above the ledge is a belt of "trachyte" which is traversed at a hight of five feet above the ledge, by two strata of white fieldspathic clay, each about one inch in thickness, giving to the sides of the tunnel a regularity of appearance, as if they had been purposely striped by the hand of man.

Some very beautiful stones have also been found in another hill east of town, and about a mile from the *Occulis Mundi*. These are principally "moss-agates," many of which are exceedingly beautiful. They are found in veins traversing a stratum of hard ferruginous, volcanic rock, in which they are so firmly imbedded as often to break before they will be separated from it. Many of the stones from both these claims have been cut and polished by Dr. H. M. Stuart, of Mokelumne Hill, to whom the company are indebted for the beautiful display of cut stones made by them last fall, at the Mechanics' Fair at San Francisco. One of these, a fine "moss-agate" of about two carats in weight, is now worn in a ring by Mr. Geo. Leger, one of the owners of the *Occulis Mundi* who takes great pleasure in exhibiting it to the curious. I am indebted to the Superintendent, Mr. Neven, for some very fine specimens of the stones from these claims, some of which I expect to preserve during life, as pleasing reminders of a day very agreeably spent.

On the third day of my stay at Mokelumne Hill I started in company with a young friend, a son of Mr. Thomas Loutlett of this place, to visit the mine of the "Campo Seco Copper Mining Company," situated near Campo Seco and fourteen miles from here. A walk of eight miles brought us to the residence of the Messrs. Young, near the Calaveras lime-kilns, who very kindly volunteered to furnish us with saddle-horses for the remainder of our journey, which offer, after such a walk, we were not at all loth to accept, and after visiting the mine, and the smelting works near, we came back a little after dark, to the residence of the Messrs. Young, where we were very hospitably entertained for the night, and returned to town on the following day, well pleased with our trip, and with what we had seen.

THE CAMPO SECO COPPER MINE

Is owned by a joint stock company of the same name, and is superintended by Mr. D. L. Morril, under whose able management, the mine is now more than paying its expenses, and will probably soon be in a dividend-paying condition. It is opened at present to a depth of 200 feet, at which depth the vein of ore, a solid mass of sulphides of iron and copper, unmixed with slate, is twenty-three feet in width, about one-sixth of which is estimated by Mr. M. to be shipping ors, assaying from twelve to twenty three per cent. copper. The lower grades of ore are sold to the proprietors of the smelting works located near. The shaft is not sunk on the vein, but west of it, and drifts are run from it to the vein at points where it is desired to open levels. The body of ore in the 150-foot level, is forty feet east of the shaft, and is twenty-three feet in width, and is divided at the end of a drift extending eighty-five feet northward from the shaft by a "horse" of slate. This horse is not found in the lower level, but the vein is of uniform width and character throughout the extent of its drift. Besides the twenty-three feet of ore, the vein contains a mass of slate somewhat cupriferous, of unknown width, the western or "hanging wall," having never been reached. It is believed that another body of ore will be found under this wall, and acting under this belief, a drift has been started on the 200-foot level for the purpose of reaching it. This drift has been continued 120 feet, and is still in the vein. It has cut a few narrow strata of rich copper ore, but has not as yet developed any very important deposits. One thousand tons of ore were shipped from this mine during the past year, averaging 16 to 17 per cent., and it is confidently believed that the amount will be much increased during the present one. The hoisting works are driven by water power and are capable of raising thirty tons of ore daily. It is intended to erect steam works in a short time, as the present machinery is entirely insufficient for the wants of the mine.

After passing through the mine we went in company with Mr. Morril to visit the works of

THE TAUNTON SMELTING COMPANY,

Located on the Mokelumne river, three fourths of a mile below the Campo Seco mine, with which they are connected by a railroad, on which the cars are drawn by a horse. The

works ore superintended by Mr. West, and were first set in operation in August 1865. They consist of two furnaces, of a style similar to those described by Dr. De Heirry in his articles on "Metallurgy of Copper," published in the Press last year. One of these was run for forty-three days, last fall, during which time it produced 109 tons of matt, and was pronounced a success; but as it was impossible to obtain a sufficient supply of coal for the winter, before the rains set in, it was found necessary to suspend operations until next spring, when it is expected the furnace will again be fired up and kept in constant operation. The blast is furnished by a McKenzie's patent blower, which is driven by water power, and is found to work like a charm. It requires about eight horse-power to each furnace. Each furnace consumes daily from 200 to 250 bushels of charcoal, costing here twenty cents per bushel, and employs six men, besides outside laborers, employed in the process of preliminary roasting, which is performed in kilns, consisting of immense heaps of ore, at the bottom of which is a small layer of wood. This process drives off a large proportion of the sulphur in the ore and is performed at a very slight expense, the entire cost of this operation being estimated at one dollar per ton.

After an hour very pleasantly and profitably spent in looking at the works, and in conversation with Mr. West, we leaped into the car and were soon at the mine, where we mounted our horses to return.

A PEDESTRIAN TOUR.

I have this evening returned from a pedestrian tour of a week's duration through the copper mining districts in the lower part of the county, which I found with few exceptions in a deplorable state of decay and stagnation. I left here last Friday morning and proceeded to Jenny Lind, where I found some of my former acquaintances and the old subscribers for the Press; but with the exception of one or two, who were away from town at the time, they were all "dead broke," and the village seemed to be completely played out. After putting up for the night with the worst hotel accommodations I have ever found in California, I left in the morning for Brushville. This place shares much of the dullness of its sister town, but as I found here many of the acquaintances whom I had met on former visits my stay was much more agreeable. Copper prospecting has long since been abandoned, on account of want of means, while the only gold quartz mine in the place, is that of Messrs. Austin & Hathaway; having been sold to parties who have not yet arrived to take possession, business here is confined entirely to placer mining. I here met my old friends, Messrs. Gage & Eddy, and known among the most enterprising prospectors in the county, but who are now engaged in placer mining. From them I received a warm welcome, and I accepted with pleasure the kind invitation of Mr. Gage to pass the Sabbath with him at his residence, and in the society of himself and his very interesting family. The time passed so pleasantly, that for a time I forgot the dullness of business and the cares and fatigues of travel, and seemed to be enjoying the comforts and associations of home in a civilized and Christain land. But all pleasures are fleeting, Monday morning came, and my journey must be resumed; so bidding a reluctant good-bye to my kind host and his family, I set out on the road to the Caledonia copper mine, located seven miles east of Brushville, and twelve miles north of Copperopolis, on the Salt Spring Valley and Mokelumne road. The mine was not in operation at the time of my visit, other work having stopped for the purpose of putting in a new pump, one of Hooker's patent, which had just been purchased. A further walk of eight miles brought me to the Kentucky mine, Mr. Lewis Superintendent, who very kindly entertained me for the night.

NEW INVENTIONS.

On Tuesday morning I walked to Copperopolis where I spent two days, making the acquaintance of some very pleasant people, and examining some very valuable inventions, which I found had lately been made here. One of these is a safety cage, which seems to have points of superiority over any now in use, and is the invention of Mr. Wm. N. Shaw, blacksmith of the Union mine. The other is a scroll-saw, invented by Mr. Brown, who intends to apply immediately for a patent. This invention dispenses with the clumsy "sash" attachment, which is used in all other machines of this kind, thus saving a large amount of friction, and without any additional strain upon the saw, giving the full size of the working table free from obstructions, for turning and guiding the work.

COPPEROPOLIS

Is a thriving place, but suffers a great drawback from the fact of all the wealth being in the hands of a few. These few, however, show a very commendable degree of liberality in providing for the moral and intellectual wants of those who are necessarily more or less dependent upon them. A fine public school-house has lately been erected at a cost of $3,300, of which $1,500 is the gift of Mr. Thomas Hardy of the Union Co. In the principal of the school, Mr. F. F. Bacon, I found an old friend, whom I was truly glad to meet. I was introduced by him to the Rev. M. B. Starr, of the First Congregational Church, with whom I visited a new church-building now in course of erection for the use of that society. The building is of brick, in the sacred gothic style, and will cost, when completed, from six to eight thousand dollars. It is situated in the center of a fine block of ground, having a street on every side, which is the gift of Mr. C. F. Meader, who also contributes largely towards the cost of the building, showing by his liberality in a good cause that he is every way worthy of the great wealth which he has won by his enterprise and good fortune. The place also supports a weekly paper, devoted to advertising, politics, and general news, and shows in almost all other departments, every characteristic of a prosperous and enterprising town.

Owing to the shortness of my stay I did not have an opportunity of going through the mines which have given the place its business and fame, but as I hope to visit it again in a few weeks, and probably make a longer stay, I shall notice them further at that time.

I shall notice in a future letter the quartz ledges of Mokelumne Hill and vicinity, on which I am not sufficiently posted as yet.

D.

Mokelumne Hill, Feb. 15, 1866.

[Written for the Mining and Scientific Press.]

Pattison's Mining Bill in Mono County—A Delayed Letter.

Messrs. Editors:—Thanks be to the Mining and Scientific Press! Such was the feeling of every miner in this section, when, on last Thursday evening's stage, arrived your valuable journal of the 6th instant. It contained the Hon. Mr. Pattison's bill for "An Act for Acquiring and Maintaining Titles to Quartz Mining Claims."

Unless you had, with usual enterprise, published this proposed law in full, we would all have been in ignorance of its provisions until too late. It was scanned over, and then thoroughly canvassed, and was universally decided to be ruinous to the interests of the quartz mines of Mono.

Calls for a public meeting were written out, and sent to the neighboring districts, and a larger gathering of miners scarcely ever assembled than met to-day at Purtzwick. Representatives were there from Montgomery, Indian, and almost every district in this end of the county. Will Hicks Graham, of Montgomery, was selected Chairman, and T. A. Cutter, of Blind Springs, Secretary. After a lengthy discussion, which was all one way—opposition to the bill—a committee representing five different mining districts was appointed. They occupied several hours in the further consideration of the merits of the bill, and reported against it, for the following reasons: First, that in different localities the extent of the claims must naturally be different. Second, that it is impossible to trace a ledge in three days, least of all mark and stake it as required by law. Third, that in this county it is impossible in the winter season to either visit or send to the county seat (Bridgport) and have the claims recorded. Fourth, for the same reason, the necessary affidavit of work done could not be filed in time; that the storms would prevent such works, and in many cases the Indians, by driving the whites from the claims, have obliged the miners (as in White Mountain district) to suspend operations. Further, our present mining laws of the districts require now an ample and sufficient amount of labor to be performed. Fifth, the miners here are opposed to further taxation in the shape of licenses; but believe that if it is necessary to obtain a revenue from the mines, it should be from the amount received on sales of ledges and from the products therefrom; they claim that the business of prospecting is a most arduous one, and in many cases a question of chance only, and that it should be fostered and encouraged, and not made subject to onerous taxation. As a whole, the miners of this county believe that our present system of district mining regulations is all they want, and therefore simply desire the assembled wisdom of the State to leave them alone.

The report of the committee was unanimously adopted, as well as a resolution instructing the senators and representatives from this district to oppose the entire bill, or at all events to have Mono county excepted from its provisions.

The meeting also adopted a resolution, thanking the Mining and Scientific Press for its watchful care over the interests of the miners.

Of one thing you can rest assured, a more unpopular bill, as far at least as this section of the county is concerned, was never introduced, and we shall all breathe easier when it is defeated.

There is but a few moments' time until the express leaves. The Cornucopia company have gone through the iron streak, and again struck the mineral; it is very rich, and looks better than ever.

The Sierra Blanc are putting up cabins and blacksmiths' shops at each of their claims. They are working seven of them, and all look well, particularly the Crocker, where they are now taking out fine pay rock.

The Diana, with their little 4-stamp mill, (about as big as you could pack in a good-size trunk.) forward, to-day, three hundred pounds of bullion, the result of two weeks' work.

Everything is going along smoothly, all are in fine spirits, and there is not a man out of employment who will work.

In haste, yours truly, X.

Purtzwick, Blind Spring District, Mono County, January 14, 1866.

[Written for the Mining and Scientific Press.]

Mammoth District, Nye County, Nevada.

Editors Mining and Scientific Press:—That a mining district so rich and extensive as Mammoth, should exist so near and be so little known, is truly a matter of surprise to the visitor here. The district was discovered two years ago, and most of the pioneers remain here. They appear to be an exception to most of our prospectors; having settled down to develop their mines in good earnest, caring but little what is going on in other parts.

The district is situated in the Mammoth range of mountains (Nye county), about sixty miles S. W. from Austin, ten miles due west from Ione, and only thirty miles from or south of the overland road, the nearest accessible point on which is White Rock station. The district is ten miles square, embracing both the east and west slopes of the range.

ITS GEOLOGY.

At the base of the east slope the formation is phorphyritic; ascending very gradually west, the formation changes alternately to greenstone and primitive limestone. On the western slope we first encounter green stone, changing to slate at the base. Innumerable lodes traverse (uniformly north and south) each formation for a distance of two and a half miles, then disappear, trachitic rocks taking the place of the greenstone and slate.

ITS MINERAL VEINS.

The lodes on the east side have been the most worked, although there are many on the west extremely rich in gold at the outcrop, free gold being plainly seen throughout the rock, which is much decomposed. There are others remarkably rich in copper ore, of the peacock variety, containing in addition considerable gold and silver. On this slope are also two immense lodes of magnetic iron, sixty to seventy feet in width, outcropping for twelve or fourteen hundred feet. This ore is very pure, much of it yielding 85 per cent., and the whole mass above 60 per cent. These iron lodes, or beds, are so extensive that ages will be required to extract the ore in sight, Surrounding these mines, and for many miles north and south, is one of the most extensive tracts of nut pine in Nevada.

Here seems to be at once overcome one of the greatest obstacles to the rapid development of this vast silver region—the cost of machinery for new mills, and that to take the place of those worn out. Machinery can here be cast from the furnace direct, at less than half the cost of transportation from California.

This district is remarkable for its great number of argentiferous lodes, similar in character, and all carrying pay ore from the surface.—They are generally large and well defined, many of them outcropping for a distance of three or four thousand feet. All of them have the same general trend—north and south. The ores are very tractable, being unusually free from the baser metals. They are chiefly of the chloride variety, at or near the surface, invariably changing to sulphurets as a greater depth is attained. The chloride ore usually extends down 25 to 30 feet, although siliceous sulphuret, in connection with the above, is met with in many of the lodes from near the surface. (I speak only of the predominating ores; although every known variety and combination of silver exists here.) There are thirty or more lodes opened to depths ranging from thirty to eighty feet; three or four have reached one hundred feet; two considerably more than one hundred feet, and a great number from ten to twenty-five feet; in every instance, with the deeper ones, there is the unmistakeable evidence of permanancy, and of extensive mines of sulphuret ore of high grade. Two or three companies have reached the Ruby ore, heretofore only found in the Austin mines in any great quantities. Should the highly concentrated ores peculiar to the veins of Austin occur here, generally, (as they already have in some of the deeper shafts) there is no estimating the wealth of this district. Considering the great power of these lodes, it will be vast indeed.

MINES BEING OPENED.

Along the line of junction, between the porphyry and greenstone, are some particularly fine claims, among which are (beginning south) the Silver Cloud, Uncle Sam, Almaden, Erie, Josephine, Hatch & Graham, and Gould & Curry; with the exception of the first, they all contain precisely similar ore, and possibly belong to one mother vein. From all the above, working tests have been obtained, at the Austin and other mills, which prove them to be of great value for their top ores alone, having yielded from $80 to $300 per ton, and the first mentioned much more—something near $550, I am told.

The next east, is the Keyetone belt, in which is the Keystone (beginning north), Silas Wright, Enterprise, Yolo, Ellsworth, Fleg, Knickerbocker Series, Rough Diamond Series, Pearl, Excelsior, etc. In the next belt east, we find the Secremento, Vigilante, Sabine, Martin. Still further east, is the Live Oak belt, containing the Live Oak group—El Dorado, Yuba, Huron, Juanita, Northern Light, Cactus, and many others. From many of them average lots of ore have been worked, yielding from $80 to $250 per ton; in no instance less than the former sum.

It must not be supposed this is even an approximate of the number of lodes in the district; "their name is legion." In due time they will commend a hearing by the tide of bullion that will flow from Nye county, when the mills now in course of construction and in contemplation are running. At present the mills of Mammoth consist of one small three stamp, nearly completed, owned by W. T. Jones, an early settler here; and one crusher or grinder, about ready to start. The latter is owned by Henry Van Horn. These, with several larger ones to be put up in the spring, can run on ore already in sight, or proved to exist, for years. Mills cannot be in advance of the development of the mines here, for pay ore is found in abundance at the surface.

In a broad cañon, convenient to the the mines and adjoining, the two towns of Weston and Ellsworth are laid out. They contain forty or fifty well built houses, and are rapidly building up, notwithstanding the cold weather and snow. Wood and water are abundant here; the supply of the former is better than in any mining district I have visited in Nevada. The entire range of mountains north and south is densely clothed with juniper and nut pine of superior growth. With all this in view, who shall say Mammoth district is not one of the many spots of promise in silver-ribbed Nevada

A. J. H.

Weston, February, 1866.

Boasting.—People who are always talking about what they can do, are generally found to be the most inefficient when the time comes for action. The Spaniards illustrate this fact by a little fable. In Spain there is a small bird called St. Martin's Bird, about the size of a wren, with long, slender legs. They say that one hot Summer day this little bird lay down to enjoy the sunshine at the foot of a tree, and raising its long legs upward, said: "What do I care; if the sky were to fall now, I could hold it up with my legs!" At that very moment a leaf fell down from the tree, and the bird, frightened nearly to death, flew away, screaming, "Oh, St. Martin, St. Martin, come and help your little bird!"

A Brave Boy.—A few days since a little boy, Willie Soule, son of Dr. A. G. Soule, fell from the balcony, in the rear of his father's office on Kearny street, in this city, to the ground, a distance of over thirty feet. No one saw him fall; and it is supposed he must have lain insensible fully five minutes before he was noticed. He was taken home immediately, when it was found that one of his legs was broken, and he was otherwise seriously injured. He bore the pain of setting his limb like a little hero. Looking up into the face of his mother, who was standing by weeping, he said "Don't cry, mother, it's not so bad as if I'd been killed." After the leg had been set he said: "Father, I don't think I can go to school to-morrow."

REPORT

ON THE

Mining District of BATOPILAS, in the State of CHIHUAHUA, MEXICO.

[Extracts from a work just issued from the Mining and Scientific Press Job Printing Office.]

(Continued from Page 133.)

LA "DLORES."

No documents existing as to tbe amount of silver it has given, or of the time when it was worked or abandoned, the traditionary fame is at our day the only guide left. It is to he remembered tbat the mine must have been neglected for over one bundred years, during whicb time the rains have wasbed away almost the entire attlepile, and the works generally filled up with rainwater to within ahout twenty varas from tbe surface, to which point the mine is accessible. As to its depth, nothing definite is known, we must therefore allow a medium of 80 to 100 varas.

I understand from authority, tbat according to tbeir knowledge on the suhject, it was began to he worked in or ahout 1729, by two Spaniards, Don Pedro Sanchez and Don Guillermo Gutierrez, wbo prospected the lode in various places, although to a very inconsiderable depth, until they struck it in a place where it gave them better inducements to follow. From bere it began to improve, until, wben it changed into tbe hands of other parties with more capital, it netted tbe second year over $250,000, and continued for some ten years afterwards in good paying ore, most of tbe time being in *heavy bonanza*, in some years netting as much as one million of dollars. About 1740 it caved in, by improper management, suffocating several miners.

One of my men told me that wben he was a boy, about 1818, two of his uncles entered tbe miue as gambusinos, and, at ahout from twenty to thirty varas depth, tbrew down a pillar, from which, according to the best of his recollection, they took something like $9,000 in splendid white silver. He used to aid them in carrying out tbe rubhish. They were stopped in further explorations by a shaft filled with water, since when be had not entered tbe mine again until I took him up there as a guide.

For a great number of years the mining population of Batopilas has heen in the habit of going tbere after each rainy season, to wash tbe *terrero* over, sometimes extracting bandsome returns therefrom. Even at the present time tbey still do this. I saw last year eight or nine stones about the size of a walnut, of almost pure silver, which a hoy bad picked up from it.

An old woman, still living here, some ten years ago, hunting up the arroyo, found a mass of virgin white silver, without a particle of matrix adbering, whicb evidently was wasbed out from the attlepile, for which the late Don Marcos Viniegra paid her $182—at the rate of $7.50 per mark of silver (8 ounces). In fact, the fame of this mine is so well established tbat there is bardly a child in tbe place tbat does not know of the "Dolores."

In my opinion, the most proper way to open this once so celebrated mine, would be by means of a tunnel commencing about sixty yards to the southeast, which would strike the lode in this distance, and thence continue on it some forty varas, to get helow tbe probable location of tbe bottom of the old works.

Taking into consideration all the circumstances of its history, its good mineral ground, location and general appearance of the vein, it is more than probahle that with a comparatively small outlay, this mine could be worked again into a second bonanza.

EL "CARMEN."

One of the mines forming the so-called "San Miguel" claim, near and to the west of the "Sau Antonio," which it resembles very much in its general character. It was worked principally about tbe beginning of this century, hy a Spanish gentleman, Don Angel Bustamante, who, it is said, spent all his means in opening it, without meeting with any success during twenty-two montbs. At the end of this time he became entirely discouraged, and had resolved to abandon it, when, he suddenly struck the first silver of what proved to be an immense bonanza, going down 160 varas in depth, out of whicb he loaned to the KING OF SPAIN over one million of dollars, in acknowledgment of which he received the title of MARQUIS. Tbe amount taken out is known to have reached over fifteen millions.

Several old persons are still living in tbe district, who, when boys, worked in the mine, and remember that in several parts of it, metal was left. It is now, however, filled up witb rainwater to a considerable degree. The "San Miguel" tunnel is destined to cut it below its old works.

THE "OBRA DE SAN MIGUEL."

This is the name given to a tunnel, eventually destined to cut all the sixteen or eigbteen veins, which lay in and form the great claim of like name.

This highly important work was first commenced some ten years ago, by a Mexican named Mendazona; who, being a poor workman, hut of considerahle spirit of enterprise, worked the mine "San Pedro," struck bonanza there, and became a wealtby miner. His health, however, giving way, and his fortune dwindling by accidental losses, he was finally obliged to give up, after driving it about 100 varas.

The claim, about tbe year 1860, got into the possession of an American Company, very ably represented hy their wortby agent, Mr. J. Robinson, under whose direction the work has heen energetically continued, and now attained a length of 200 varas.

As already stated on a former occasion, the lodes lay continuous, more or less in a soutbeast to a northwest direction, averaging about fifteen to twenty varas distance from one another, with the exception of the "San Antonio," wbich slightly differs in its course from them.

Some of these are celebrated as former *bonanza mines*, wbile others have given more or less riches, and some may as yet be virgin. Besides there are a number of lesser veins and tbreads known to run into tbem, which of course will gradually become developed, and may also reasonahly he expected to give returns, as several such, for instance in the "San Antonio," "El Carmen," etc., have formerly been found in first-class metals.

One, or, in fact, the first regular vein cut by the tunnel, is tbe so-called

"FIERROS."

Out of which Mendazona, in a very small work, took first-class ore; also Mr. Robinson, hut it has not been worked to any great extent, and holds out tbe most flattering prospects, if furtber opened. Some three or four threads have also lately heen traversed, every one of tbem showing splendid metal.

Mr. Robinson, who is absent on a visit to New York, I understand intends, after his return, to push the work energetically, and there is not the sligbtest reason for doubt that, once fairly started in there, on some of the lodes laying ahead, the "San Miguel" claim will reward its owners with another immense bonanza, and thereby, at once, raise the old fame of Batopilas anew over all other mineral districts of Mexico.

Another of the formerly celebrated *bonanza mines* of the same claim is

THE "CANCIO."

Now also abandoned and filled up. Notbing as to its works is now known. The lode shows, however, tbe same points as its neighbors, as well as all the different veins on the hill. Characteristic of tbe metal coming from them, is its extreme richness in sulpburets, besides the native silver.

THE "MARTINEZ"

Lays on the west side of the river, on a spur of the Cerro de Animas, in excellent mineral ground.

Tbis mine was worked about the year 1816 and 1817, by the Marquis of Bustamante, who extracted therefrom a considerable bonanza, principally from those parts extending to the south, where, it is said, they still bold out strong inducements for following it up.

THE "SAN PEDRO,"

West, and between the latter and the "Pastrana," is a mine of considerahle reputation. It was first discovered and worked a little by gambusinos, until later it got into possession of the already mentioned Mendazona, who struck it in rich metal, and followed it down to about 70 varas, perpendicularly, out of wbich he took some $200,000, part of it in beautiful massive silver. It is said that this mine and the "Martinez," gave the most beautiful specimens of bright white silver imaginahle, some of which were sought and paid for at more tban their triple value.

The lode runs from southeast to northwest, and shows a splendid vein of three-fourths of a vara in width on an average, of very white calspar, with some crystals of galena. Mr. Robinson worked in one part of it for some time and took some very good ore from it. He left this mine, however, because his whole attention was directed to tbe important work on the "San Miguel" tunnel. It belongs to the same American Company, who hought both claims from Mendazona. The works are perfectly dry and accessible to the bottom, and in good working order.

Any works recommenced on it that would go deeper, and develop the lode in different directions, would undouhtedly bring it again into a remunerating state within a comparatively short time, as all the *geological features* connected with it are very promising indeed.

I understand tbat both of these mines have lately heen sold to a company in New York, wbo will immediately send an agent out to commence operations.

THE "SANTO DOMINGO,"

Adjacent to the "Roncesvalles," which it is supposed it will join in the lower workings. The lode lays in the same excellent mineral ground, with a general direction from south to north, dipping 18° West.

It was first discovered by one Don Nepomuceno Avila, who, about twelve years ago, while out bunting for leads, accidentally came upon this, at a place where the ants had strewed the ground with bright shining silver particles taken from the lode. It was taken possession of, and worked for about two years, by a Mexican lady of remarkable energy, Doña Trinidad Ortiz.

The works on the lode are almost perpendicular, following the dip of the metal, whicb appears to have been a cbimney of remarkably small longitudinal direction, as hardly any works in tbat direction exist. It is about 60 varas deep, and gave something over $40,000, partly in white massive silver, and partly in extremely ricb chlorides and red and black sulpherets. It was especially noted for the heauty and large pieces of crystals and ruby silver.

After the old lady left off working it, one Dr. Wright purchased the claim and continued to sink a sbort distance, and took out about $8,000 in most splendid metal, some of which gave $1,400 to the 100 pounds, while the average lay ran up to $800 for tbe same quantity. A misfortune that hefell him soon after, in breaking one of his legs while descending into anotber mine, caused him to desist. Tbis gentleman getting, tbereby, into reduced circumstances, left Batopilas, having transferred a part of his claim, including, also, the "Roncesvalles" and "Santo Tomas," to a Mexican who only works them at intervals. Perseverance would, in all probability, bring the mine again into a paying state.

"SANTO TOMAS."

The ore appeared on the very surface, some of it giving $14 to the pound. But tbis proved to he only a small pocket yielding about $600, and tbe discoverer sold out. The purchasers found, after sinking ten varas, two other pockets, yielding about $1,500, and then transferred their mine to two Americans, who, after sinking three varas, struck another pocket of very rich silver, mostly averaging $15 to tbe pouud, and in pieces of from six to ten pounds.

Tbis pocket gave tbem about $7,000. After these, Dr. Wrigbt stepped in and took out another pocket of some $4,000. It is now beld by the same parties as the foregoing, and from the fact of having given such pockets witbin a very short distance, would seem to hold out inducements for another more extended trial wbereby larger deposits may be discovered.

THE "SAN NESTOR"

Is to the east of Batopilas, on the other side of the river, near the top of the hill in which lay the "Nevada" and "Candelaria." It was first discovered some ten years ago by Avila, and worked by Doña Trinidad Ortiz, to whom it gave a bonanza, beginning from the very surface. Its depth was never more than thirty varas, with very little longitudinal extension.

Since then it passed into the hands of a Mexican Company, who, after working it for a length of time with very little success, struck, about six months ago, into what appears to be a new bonanza, the extent of which it is impossible to foresee. The metal throughout all the works is good, in parts it is of the first class, and much of it in solid silver.

They are also running a tunnel somewhat lower down, which will determine the downward tendency of the deposit.

LOS "TAJOS,"

A mine from sixty to seventy varas to the south of the latter, and also on the very top of the hill.

This mine was worked, as its name indicates, by mere surface openings or ditches along the lode, which seems not to have gone down more than from fifteen to twenty varas. The ore was found from the surface in rich "bodoques," (chlorides,) and massive silver, but temporarily gave out, and nobody took the pains to sink any deeper, although there is no reason to doubt that, with proper working, this mine would give anew as rich returns as its neighbor, to which, in its general characteristics, it bears very strong resemblance. This claim is owned by Mr. Frank Heard, at present at Batopilas.

LA "VALENCIA,"

Some 80 or 100 yards to the southwest of the "Tajos," is also a mine of recent date, which gave, in three shafts of from seven to ten varas depth each, three different rich pockets, varying from $6,000 to $12,000.

As no further prospecting has been done, except a small gallery, the lode may be called, as yet, virgin, and certainly holds out very fair inducements to follow up the direction of the silver, which, it is said, began at the surface. It enjoys great confidence among the mining population, and belongs to parties represented by Mr. Frank Heard.

THE "AURORA,"

Is on a spur of the "Animas" hill, to the north of the town, and of recent date.

The general direction of this lode is from south to north, running, so to say, right into the hill, very advantageous for the construction of a tunnel. The ores, like those of all other mines in the district, are composed of calspar, intermixed with white and black silver. A number of other lodes and threads run almost at right angles with the main lode, some of which are of considerable dimensions, as, for instance, the "Veta Grande," and give, combined with the excellent mineral ground through which they shape their course, excellent hopes of very rich returns. None of them have ever been worked to any considerable extent, merely been picked at. Even the "Aurora" proper has but very little depth and extension, although it gave considerable silver. It is not worked at present, and belongs to the owner of the "San Nestor."

THE "SANTA TERESA,"

On the spur to the east and opposite the former, is likewise in the same hands.

The rock composing the hill consists principally of diorite, joined at the present mouth of the mine by a stretch of stratified rock, and the mineral ground (*panino*) particular to the claim belongs to what is here called the "black" one, (*panino negro,*) the ores of which are generally found much poorer than those of the "white," so much so that only the *visible silver* is counted upon, while in the other the *not visible* will pay even richer. A great number of holes of no great depth perforate the claim in all directions, showing that it was frequently resorted to and prospected, but whether it gave anything worthy of consideration is not known, as no documents relative to it exist. The same lodes which cross the "Aurora," continue through this claim, in combination with a number of others, more or less traversed by the "Santa Teresa" lode proper, which dives into the hill.

Several years ago, this claim got into the hands of a Mexican Company, represented by one Don Jesus Valenzuela, who worked it for two or three years, only enough to hold it within the law. About one year ago they struck a cross vein and got into very rich metal, which, since then, they have been following up, and have already taken out considerable silver. For the last eight months they have worked in this without taking the ore out, but they will do so in a few weeks, and I understand that it will undoubtedly give them a very fair fortune, as a part of it seems to be very rich indeed.

For the past two months, they have cut several veins in a work which they are driving, tunnel-like, on the "Santa Teresa" lode, every one of them in splendid silver, although they have not, as yet, opened any side works on them. At the same time the *panino*, thus far into the hill, seems to change very favorably. Last week they struck solid silver in one of them, of three fingers thickness, the first piece of which taken out, I saw, weighed over fifty pounds; and I have also seen many very rich samples from other parts of the mine.

Several shafts sunk in various parts go to show that the metal extends downwards, so that there is no doubt whatever, that this claim has at last entered upon a bonanza which eventually may turn out an immense one, considering that the whole of it is as yet virgin ground.

LA "VACA"

Is a mine located on a spur of the "Animas" hill, west of the "Aurora."

Several lodes cross, or join each other, near the point where a small work has been driven on the above named lode. This, however, does not consist of more than a shaft of about eight varas depth, and a gallery of some twenty varas length, from both of which good metal has been taken. On the other leads similar works are to be seen. I have not been able, however, to get any information as to what the results have been.

The "Vaca" gives very fair promise, and needs only proper development to bring its treasures gradually to light. Its owners, Messrs. J. Robinson and Thos. Laven, I understand, have lately sold their interest to a New York Company, who, I hope, will go to work in a business-like manner to find their rich reward.

One of the above named lodes, which is included in the "Vaca" claim, is the

"VALLINAS,"

Which is known to have given a considerable bonanza in former years, although its precise history is now lost to us. The works on it seem to have fallen in, and nothing of them but a large opening (*tajo*) is now to be seen, where the principal entrance was. I have heard that the works have never been deeper than 70 varas; so that a tunnel run in at a somewhat greater depth would be advisable. In fact, there exists such a one to the west of it, commenced by a Frenchman, several years ago, but not continued for want of means.

The mineral ground through which the lode runs is of the first order, and should certainly give strong inducements for more extensive works. Its neighbor to the west is the "Martinez," about 200 yards distant, with the "Aurora" about the same distance to the right.

THE "ANIMAS,"

On the north side of the "Cerro de Animas," was first discovered twelve years ago by an Indian, who divulged it to Doña Trinidad Ortiz. This lady worked it for some time, and took therefrom about $30,000, mostly in massive silver, beginning from the very surface. At about fifteen varas depth this deposit gave out, and, true to the Mexican spirit never to exert itself in *borra*, the metal was not followed up, but abandoned.

A couple of years ago the owner of the "San Nestor" mine commenced it again, and although only of late working it off and on, with a few men, is getting into very fair indications, which may lead him into a rich deposit of silver, as the lode is yet perfectly virgin, and all other circumstances connected with it highly favorable.

THE "BALTAZAR,"

Likewise on the north side of the "Animas" hill, on a spur to the east of the "Animas" mine. This is a very promising claim, in excellent mineral ground, consisting of a regular vein, and quite a number of lesser hy-veins which cross or join one another in different directions, mostly running west to east, while others from south to north.

The former, apparently has never been worked; one of the latter, however, in years gone by, must have given a large bonanza, as its fame ranks high among such. Very likely this consisted mostly in massive silver, commencing from the surface. Now there is only a large opening to be seen along the vein, some twenty-five feet deep, with an inclining shaft running therefrom southward, in which the *cinta* shows itself somewhat narrow. This work was principally given in *stratified rock;* that would seem, in case it should extend further in and downward, to indicate, or at least to justify the hope of another rich strike below where it joins the diorite, which forms the principal rock of the spur.

The other veins, wherever they have been worked a little, (and very little work has been done on them, by gambusinos principally,) have always given pockets of rich, mostly massive silver. The last one that worked on one of them, Mr. Wm. Hooper, an English gentleman, who resides here, and now works the "Santo Niño" mine, took some $6,000 from about five varas; but he says that he lost more than one-half more by carelessness in watching. His attention being drawn off by other mines, he left it; since then until quite recently the "Baltazar," has lain unclaimed.

The entire length of the works on this claim does not go over thirty varas; therefore it may still be considered virgin ground, and, considering all the circumstances, in my opinion, certainly a claim very worthy of attention, as it very likely may contain great riches. At least it appears that only comparatively very short distances separate the various deposits of silver, and lead to the supposition that further in towards the centre of the hill, these will augment until, at greater depth, they may form a grand body. The rock in the claim is remarkably soft, and therefore easily worked; wherefore the gambusinos like to go to the "Baltazar," which, in itself, is another recommendation.

On the same side of the "Animas" hill, are two or three other lodes, which respectively have given bonanzas, or at least considerable bodies of silver. For instance, the

"TRINIDAD,"

Which, about the year 1820, in a small work of about sixteen varas depth, gave $40,000, mostly in large lumps of massive silver, and was then left. It was a few months since claimed by Mr. George Le-Brun.

THE "GUADALUPE,"

Which gave, equally from the surface, in a very short distance, a great amount of metal.

THE "SAN PEDRO VIEJO,"

to the west of the latter, but in a different mineral ground, and others, all of which, after having laid abandoned for many years, have of late found owners who, I hope, may go to work in proper earnest, and reap the reward for which their appearance, location and history justify the hope.

THE "CARMEN" CLAIM,

Comprising a number of claims—some sixteen or eighteen—the majority of which run parallel with each other, in very short distances, and equally good *panino*, from southwest to northeast. Its location is near the top of a high hill to the southwest of the town, called the "Cerro de la Descubridora."

Several of these lodes have given very rich bonanzas, some forty to fifty years ago, as, for instance, the one known as

LA "GUADALUPE,"

Out of which over $100,000 were taken. The works do not go over forty varas in depth, but are at present partly filled up with rubbish.

Mining Summary.

CALIFORNIA.

SHASTA COUNTY.—The *Courier* says that a lode of copper bearing rock, which, for richness surpasses anything heretofore seen in that county, was recently discovered by Mr. Pierson, in the southeastern part of the county, about twenty miles from Shasta. The discovery was kept a secret for some time; but the locality is now known. A nugget worth $272 was taken from the Dog Creek mines a short time since.

BUTTE.—A correspondent of the Marysville *Appeal* speaks very encouragingly of mining operations in the hydraulic claims in the vicinity of Timbuctoo. Considerable difficulty has recently been experienced on account of a misunderstanding between the Excelsior Canal Company and the Shamrock Mining Company. This quarrel compelled the suspension of operations on the part of several other companies, until Mr. James O'Brien, of the Perry & Evans claim, terminated the difficulty by purchasing the Shamrock ground for $8,000. In so doing, he has done a great favor for the general mining interests of the neighborhood. The Easton company, which recently made an extensive purchase on Squaw creek, is making rapid strides towards opening their claims, under the management of E. F. Williams of Smartsville. The company employs about thirty men, and it is expected that the claim will soon be yielding large returns. The Blue gravel claim on Sucker Flat still continues to pay as well as ever. Mr. Chamberlain, Superintendent of the Squaw Creek mining company, has sunk a shaft sixty feet deep, and struck the blue gravel. He proposes to erect machinery for pumping and hoisting in order to thoroughly test the mine.

The Andrew Jackson quartz mining company are about to resume active operations under the supervision of L. B. Clark. They have had a lot of rock hauled to Grass Valley for crushing which gave satisfactory returns. The company are about to erect machinery, and test the mine thoroughly. The Marc Antony quartz mining company had to suspend operations on account of too much water coming in from the late rains. They have out a huge pile of quartz, but have no machinery as yet to test it. They intend starting again soon.

NEVADA.—The *Transcript* learns that Still's mill is kept in constant operation crushing quartz from the celebrated Wilmington lead on Gold Flat. At the last crushing, some two years since, from which time it has been unworked until lately, it yielded $35 to the ton. No returns have yet been made public as to its present yield.

Work has recently been resumed on the Mattingly ledge. Some years ago several crushings were taken out of this ledge, and worked at Grass Valley and Nevada, but did not pay. The owners are still confident of the richness of their claims, and are determined to prospect it to a greater depth. This ledge is upon the same range as the Star Spangled Banner. There is no reason why it should not be rich.

The Kistil company on the Prosper ledge, on Canada Hill, is constantly at work, with most gratifying success. Last fall stock in this company sold for $30 per share; a few days since a share was sold for $150, which was bought in by the company for $500. A lot of eighty tons of rock is now being crushed at the French mill, and it is expected the returns coming to the above share for this lot alone, will refund the amount paid for it. So says the *Transcript*.

The *Gazette* says the Pennsylvania mill was started up on Monday last, for the first time since it came to a sudden stop last fall by the bursting of the boiler. They have out about fifty tons of ore, which it is thought will pay $70 to the ton. The indications are favorable for this becoming one of the best mines in the vicinity.

Some very rich rock is being taken out of the Deadwood ledge, near the Oriental mill. This claim paid remarkably well some years ago, and the original discoverers each made a small fortune by working the ledge and selling out. It has been worked but very little for several years past, never having been opened to any depth.

The Excelsior Mines.—We hear that the Excelsior mills have been stopped for want of ore. A correspondent of the Virginia *Enterprise* says that Winton's mill has been crushing rock from the Pacific ledge and made good results. The California mill will start again in a few weeks and will make the next crushing from the famous California ledge. The Enterprise mill is not yet finished, but may be completed by the first of April. The months of February and March will eventually be the hauling season. During these two months the snow is compact so that a road may be broken anywhere with but little trouble, and with no danger of its being filled up with snow. The advantage of hauling with sleds and oxen, compared with mules and wagons, are obvious, and our millmen and others will be prepared for this another season.

CALAVERAS.—The Copperopolis *Courier* says that a number of companies which temporarily suspended operations last fall, in this and adjoining districts, are now making arrangements to resume work. Besides these are numerous other companies which intend to commence work on their claims next summer. The permanency of the Union and Keystone is giving capitalists confidence in our mines.

AMADOR.—The Amador Cinnabar mining company have commenced work in earnest upon their ground, and it will not be long before they will be able to ascertain the true value of their claim. Persons who are familiar with this kind of mining speak well of the "prospect."

The *Ledger* learns that another quartz mill will soon be commenced near this place; it will be erected for the purpose of crushing the rock taken from the Kennedy, one of the richest lodes in this region, which has been worked for a number of years very successfully—the rock taken out being crushed at the Oneida mill.

MARIPOSA.—The Mariposa *Gazette* of February 24th says last week a very rich strike was made in the Cerro Rico quartz vein, owned by Jose del Cermen Rodriques, and some five or six thousand dollars taken out. The gold was very coarse, some pieces weighing from two to three ounces. The vein is situated on Bear creek, a short distance from the town of Colorado.

FRESNO.—Highly encouraging accounts, says the Tulare *Times*, are received of the development and discovery of copper mines in Fresno county. In the Ne Plus Ultra mine, which has recently opened rich, a sale was made a few days since at a high figure; the purchaser being satisfied that the lead is a rich and permanent one. A new vein was recently struck about eight miles from Millerton that promises to prove valuable. Public interest is strongly enlisted in the subject, and important discoveries may be anticipated. There is no doubt but the region around Millerton is rich in copper ores.

The Thorn quartz mine, on Little Dry creek, which has been worked imperfectly with arastras for a year or two, is proving extremely rich, and negotiations are now pending for the sale of the whole or a portion of it to a San Francisco company.

TULARE.—We learn from the *Examiner*, that the Wolfskill mill is now running steadily. It works most magnificently. A better lot of machinery has never left San Francisco. They have made one run of thirty-five tons of ore from the Baptist lode, from which they cleaned two thousand five hundred dollars. They design putting up ten more stamps immediately.

HUMBOLDT.

The *Register* says that the Monroe Series, a gold quartz claim in Dun Glen, has been showing up admirably of late. A lot of five tons of rock, recently worked at Holt's mill, yielded $2,500. At a depth of about 72 feet, the men came upon richer rock than ever before. One of the men thinks the rock taken out will yield $2,000; but probably, being an owner, he was a little too extravagant in his estimate.

The Daniel Webster company has let a contract for the extension of the tunnel 100 feet further into the mountain. The workmen expect to tap the ledge near the end of this run.

ESMERALDA.

MESSRS. EDITORS: Since my last, very little of interest has transpired in this camp; stormy weather has kept mining operations back. But *one mine*, that I know of, has steadily kept working. The "Crockett" on Last Chance Hill, under the management of Mr. Gallagher, has been kept to work through all kinds of weather, and from the appearance of the rock that I have seen it will richly reward him for his perseverance. I understand that he purposes putting on a larger force when the days get longer and the mine will justify him in doing so.

OTHER MINES

Will soon resume work, and the clank of the hammer and drill will resound all over (and under) the hills adjacent to Aurora.

There are many mines here worthy of being worked, that would pay well if the owners would only look after them, themselves; instead of letting contracts to parties to take out the rock (for a nominal price per ton, which they seldom or never get), said parties not caring in what shape they leave the mine, so long as they can gouge them out and make them pay themselves; leaving their waste rock in the mine, requiring as much, if not more labor, to clear the mine of waste or bad rock, as it would to work the mine originally. I know of many such instances, and to those abroad who have the letting of such mines, I would say, rather let them lay idle than give out such contracts, as they are most injurious to the mining interests of any mining camp, and this one in particular.

THE PAUL THOMPSON.

This mine, once upon a time, was considered of great value. It lays adjacent to, and about three hundred feet due south of the original Del Monte claim on Last Chance Hill. It is now owned by private individuals, having been sold by the sheriff on the 5th June last, under an execution for debt, and the company not having redeemed, the sale has become absolute; the six months for redemption having long since expired, Mr. C. Novacovich, N. Trivanovich and some others being the fortunate owners; although their mine has been allowed to lay idle, it is not the less valuable, having a well defined ledge of good paying quartz. To a few men with capital this mine would prove a rich harvest. It might not pay under a company administration, but would pay individual industry well.

THE DEL MONTE.

The sale of this mine for taxes, together with the Del Monte mill and all its appurtenances, has been a serious drawback to this camp, and will prove so until the resumption of operations by the party purchasing. I examined the Del Monte mill a short time since, and can unhesitatingly say that it is one of the best, if not the best quartz mill that I have ever seen, and I have seen many in California and Virginia; everything is in the most systematic order, but it has been so often described, by abler judges than myself, that I will not go into further details, but simply leave it, regretting that so fine a piece of mechanism should be allowed to lay idle.

THE DAILY MAIL

has proved quite a blessing to us outside barbarians, and the citizens of Aurora and outside camps are under (or ought to be) many obligations to Mr. Willington for obtaining it for them, and to his gentlemanly son, George, who superintends its affairs. It is quite a comfort to be able to sit down to your breakfast and take up the paper every morning from San Francisco, Sacramento, Virginia, or wherever your fancy may lead you, and see and read what is going on in the outside world. Our enterprising news dealer, Mr. Michner, caters well for the public palate in the way of newspapers, periodicals and reading matter of all kinds, and, as a reward for his industry in this branch, is well patronized by the citizens, as they are all of a reading and thinking turn.

AURORA,

or rather its citizens, are making herculean strides in the literary direction. Already it boasts of its Lyceum and Library Association, which does great credit to the *literati* of the place; and with the talented Gough as librarian, it is sure to be a success. A course of lectures is now being delivered for the benefit of the Association, the first of which came off a few nights ago, by W. T. Gough, Esq. Subject: "Geology, and its relation to the Bible." He handled his subject in the most masterly manner, and so enchained his audience that a pin could be heard drop on the floor, until at the conclusion, one spontaneous acclamation went forth in honor of the orator. After the lecture came a tripping of the "light fantastic toe," to relieve the mind, by exercising the body, of the grand but eloquent subject they had listened to.

CAPITAL.

There is magic in that one word. Upon it is poised the destinies of *men* and *mines*, and when I view the amount of capital that is being invested and carried into districts hundreds of miles beyond us, unopened and unknown, I wonder of what ideas men can be possessed, or what influence brought to bear upon them, to induce them in buying large quantities of machinery, and shipping it, at enormous expense, to mines that have not had a pick stuck into them, or the least preparation made for extracting ore to supply a mill, when by the simple act of investigation they could find mines much nearer and easier of access, well opened, and ready to supply ore that would pay from the word "go." To my mind this is the most serious injury to our mining interest on the Pacific Slope—the loose manner in which great outlays of money is made. Were the parties commanding such capital to come here, examine our mines for themselves, or even send competent persons to do so, my life for it, their machinery would stop here, and they would soon be rewarded, in the shape of returns, instead of the heavy outlays that I know for a certainty they have to bear; and in the end what is their reward? a failure, and the total loss of the money invested! This sort of thing has been the curse and ruin of many of our best mining districts; confidence is lost, and, to use a common *simile*, "the burned child so dreads the fire" that he will not seek further, but let capital (what is left of it) seek investment in some other channel. I am credibly informed that arrangements have been made with an Eastern company for working capital, and that the machinery is now on the way to develop some of our mines to a greater depth than has yet been done. I am very glad to hear of this, as I have strong faith in the mines here, and capital is all that is needed to make them valuable and paying institutions, and this company I predict will be the predecessor of many more to follow when the result of their labor is known.

* * * *

[Written for the Mining and Scientific Press.]

From Brown's Valley.

MR. EDITOR:—If we had not already the world's more recent history of newspaper celebrities before us, two papers in our own State, whose names are in everybody's mind and mouth, would fully illustrate the fact that whilst political or purely party papers can seldom be made paying institutions, nor even afford any kind of satisfaction to those engaged in them, other papers, entirely identifying themselves with all the vital questions of the State, or those more particularly pertaining to their special spheres of activity, soon attain a most enviable, high and influential position, which increases their usefulness, and finally makes them powerful and most beneficial institutions. Such a position I predict for your own paper, if you continue your present efforts.

We are to-day only commencing the development of our mineral resources; and the mining interest is and ever will be paramount to all other vital interests of our State. The more I read your paper, the more I feel convinced, that for the more intelligent and economical working and development of our mines, a well-conducted medium for the dissemination of useful information is absolutely necessary. Not only every miner, but all persons interested in mining, will read it with interest and profit to themselves; and will also soon feel inclined and ready to aid not only in the collection of valuable information, but also in extending the circulation of the paper.

In most cases, success in mining is only obtained after many years of great expense, of toil and patient perseverence; and some of the more immediate causes why claims have been so often abandoned for want of satisfactory results, may be found, first, in the fact that we have in California as yet but very, very few men really able to superintend and conduct the works of such enterprise; and also, perhaps, with too sanguine, and often ridiculous expectations of those most heavily engaged in them.

It cannot be denied, however, that the management of such enterprises, this side of the mountains, has so far been more judicious, economical and honest, than in yonder silver land; and as long as our claims will not be worked under the influence and according to the more immediate and pressing requirements of a San Francisco Stock Board, there may be hope that we will get along without any crash or crisis.

Having given much time, attention and thought, during the last few years, to quartz mining, I could not fail to come to the conclusion that, for lack of faith, knowledge and perseverance, a great many good claims have been abandoned, and that the large sums of money thus spent, without any profit or advantage, could certainly not fail to increase the already existing discouragement, and thus completely disgust many of those engaged in quartz mining.

Hence, I cannot help beginning my remarks with a denial of the theory so generally admitted amongst miners, that quartz veins may pay well on the surface, and perhaps to a certain depth, and then at once fail or give out entirely. I mean to say that such claims should not be abandoned so readily. Ledges or pay streaks may disappear in the shafts, and we may, for sometime, lose sight of them entirely, as is often the case when we find a so-called "horse" in our way; but with a reasonable care, and knowledge or experience in mining, we shall always find them again. There can be no doubt of this, as a general thing, as long as we have the same casing, cap-rock, etc., as before, to guide us in our prospects. Ledges are somewhat like rivers—they pursue their course sometimes straight and sometimes crooked; sometimes small and sometimes large. It is for the miner to study his ground, and then to act accordingly.

In this connection, it may not be amiss to speak of a fact now positively established in some of our quartz claims in Brown's Valley—a fact of which I have never seen any mention made in your paper nor in any other one.

In several of these claims the pay streaks are crossing their incline shafts, at an oblique

angle of from forty to fifty degrees, and thus, very naturally, can be only visible in them to a certain depth, whilst still they continue their course uninterrupted in a different direction. In our Dann brogue claim, for instance, the strike is east and west, and the dip north, at an angle of forty-five degrees. The strike east and west being 200 feet in length, the so-called pay streak, consequently, can only exist in the shaft for a length or at a depth of about 200 feet.

Thus, the Dannebrogus, in sinking their shaft 60 feet below the point (200 feet) where they lost sight of their ledge in the shaft, had then to drift about sixty feet, in a southeasterly direction, in order to reach again their pay streak, whose course is from northwest to southeast, at an oblique angle of forty-five degrees. Their next drift, at a depth of 360 feet, or 100 feet below the upper one, had, consequently, to be 160 feet in length, in order to reach this same pay streak again.

New streaks crossing the shaft have subsequently been met with in this claim; but the quartz not paying equally as rich, they have as yet not been worked.

What I have said in regard to oblique streaks in the Dannebrogue claim equally applies to that of the Jefferson company. There, however, the strike is north and south and the dip east, whilst the pay streak is running from a southwesterly to a northeasterly direction. The streaks on this Pennsylvania lode seem to exist at short intervals of from 75 to about 150 feet from each other, and the quartz to be of the same blue color, and of nearly the same richness all over these claims. If it were not for the able management of John Howell, the Superintendent, the Dannebrogue claim would certainly have been abandoned years ago.

The Jefferson claim, which is now again paying its regular $20 dividends every month, was on the brink of being entirely abandoned, and this even at the very time when they were but a short distance from the pay streak. In one of their drifts about two or three feet, and in another but about six inches were necessary to reach it. M.

Brown's Valley, Yuba Co., Feb. 1866.

Mining about Folsom.

Messrs. Editors:—As I am about leaving this place to visit the mines and miners of El Dorado county, it occurs to me that a few items gathered amidst the hurry of other business, may not be uninteresting to you or your readers.

Experiments with Cement, Gravel, and River Sand.

On one of the bright and beautiful days of last week, I set out early for a ramble among the mines in this neighborhood. Less than a mile distant, near the road leading to Prairie City, I found Messrs. J. & W. C. Salmon, inventors of the Salmon Amalgamator and Settler, busily engaged at ground sluicing. They informed me that they had made some experiments with the gravel cement, found in their claim and throughout the whole surrounding country, in some places to the thickness of twenty feet, which yielded, after grinding in their amalgamator, from $3.50 to $4.50 per ton.—They are confident that it will be found in large quantities, where it will pay well under the stamps. If so, the good people of this place and vicinity have not been fully aware of the bright future before them, when they shall have completed their canal—which will not cost, as I understand, from a survey already made, over thirty or forty thousand dollars. It will furnish water power for an immense number of mills and manufacturing establishments. The wonder is, that such a project has not been undertaken before.

The gentlemen above named also showed me some gold samples (13 fine), taken from sand from the Mississippi and Negro bars, and from others above the bridge and mill-dam, which, after being worked in their amalgamator, assayed, respectively, from the different places, $2.40, $5.20, $8.40, $11.20 and $40.50 to the ton. If we consider the cost of mining and crushing rock from a quartz ledge, compared with shoveling up the fine loose sand on the bars, it speaks well for the prospects of the mines here, if the future experiments, which these gentlemen intend making when the water falls, should prove successful.

Many here are incredulous, because frequently not even the color can be found *on panning out.*

The reply to this is that the gold is found in exceedingly small particles, in a partially decomposed sulphuret, which readily amalgamates on being ground. Time will determine.

Willow Spring Hill.

I next visited a locality about two miles southeast from Folsom, where the miners are generally doing well—some of them having very valuable claims, which cannot be worked out for many years. Occasionally a streak is said to be found that will pay ten cents to the pan. The diggings are surface and hydraulic, yielding from $2.50 to $10 per day to the man, after deducting ordinary expenses.

Mr. B. J. Hodge has a claim here which he considers valuable, having yielded to its former owner from $3 to $5 per day to the man; but it was too far up the hillside to be properly sluiced by the natural fall of water. He consequently prepared a steam hydraulic, with a force pump, the capacity being sufficient to throw two streams of water, 1½ inches, 200 feet—something after the fashion of a fire engine, as I understand it—which will go into operation this week, and from which he expects some $15 or $20 per day to the hand.—It is to be hoped that his most sanguine expectations will be realized, as by this method many hills can be worked which could not be otherwise reached. Mr. H. also made some experiments on a stratum of gravel cement in his claim, which is not so hard as that seen elsewhere in the neighborhood, which worked, in a pan of his own construction, $15 to the ton. He also expressed the opinion that it would pay well to work it under the stamp.

From this point I hurried over to Alder Creek and Independence Flat, where the opposite state of things is met with, and where the dirt is hoisted by horse-power from considerable depths, before it can be sluiced.

On the side of the creek towards Folsom, there are only a few good claims; that of Mr. Working being of the number, which will perhaps average him from $4 to $6 to the man—the greater portion of the ground here having been pretty well worked out. On the further side, near the store of Davis & Co., where they have deep diggings, Messrs. Hart, Matthews, French, Tomlinson, and many others, have much to encourage them, not only as regards the richness of their claims, but as to the amount of ground that remains to be worked.

After leaving this neighborhood, I crossed the American river to Lee's ranch, known as Mississippi Bar. The mines were not at work with few exceptions, in consequence of a want of water, which has damaged the interests of the mines, not only here, but at Big Gulch and Beals' Bar above. This is one instance in which too much of a good thing is worse than none at all. The high water broke the dam and filled up the ditch.

On this ranch the claims are paying well—some of them as high as $6 and $10; at Big Gulch perhaps nearly as well; but Beals' Bar seems to be nearly worked out. Messrs. Small & Parker are now the only miners there, and as there is now no hotel in the place, I have to thank these gentlemen for the genuine miners' welcome they gave me. I should like, had I time, to say more of Folsom and its vicinity, but I must hasten to other diggings.

Folsom, March, 1866. Prospector.

[Written for the Mining and Scientific Press.]

Roasting of Sulphurets---Again.

Messrs. Editors: Your correspondent, J. Mosbeimer, exhibits a great deal of unnecessary ill-temper in discussing the merits of the various processes for reducing sulphurets. He is certainly very excusable for not having made my acquaintance, but such an exhibition of "touchiness," so to speak, at the use of his name in connection with a subject of general public interest, is unwarrantable. He should not object to fair criticism at any time; and if it becomes necessary to use his name in order to identify the authorship of an invention which he desires to introduce to public notice, such use is evidently justifiable. I studiously avoided condemning his "invention," in definite terms, though convinced of its defects. But I will now refer him to the excellent authority for believing myself right in the premises, contained in the very number of your paper in which his communication appears, and also in the previous one; the same being a translation from Carl Frederick Plattner, by G. W. Baker, Esq.

I know not whether Mr. Mosheimer has ever "made the acquaintance" of the distinguished authority above referred to, but certainly there is a marked "difference of opinion," in matters of fact, between him and Plattner. And as to the results, which he asserts have been attained by his "closed retort" process, any one who will take the trouble to examine them by daylight, at Mr. Mosheimer's place on Fremont street, may plainly see that very little oxidation has taken place in the sulphurets, but that, on the contrary, after being re-concentrated, they have come out as bright and about as much sulphureted as before the operation.

In conclusion, Messrs. Editors, I may say I have no malice to gratify in thus arraigning the system of another; but only a desire to place every asserted improvement upon its own merits; for by its practical results only may we know the true value of any discovery in science. A thorough practical test should be desired by no one more than by the discoverer himself. W. H. Manning.

Queries.

Messrs. Editors: In order to understand Mr. Mosheimer's process, would he kindly answer the following questions:

1st.—At what degree of temperature will sulphur combine with carbon?

2d.—At what degree of heat will oxygen combine with sulphur?

3d.—Which has the greatest affinity for sulphur, carbon or oxygen.

An answer to these questions will enable one to understand his process better.

Student in Chemistry.

Origin of Political Terms.—The term *Whig* and *Tory* had their origin in the reign of Charles II, King of England. Some writers derive the former word from *Whaig*, the Scotch for whey, and which is also the term employed by that people to designate bandits. Others think that *Whig* was derived from the motto of the Puritans "We hope in God." the word being formed by taking the first letter in each word of the motto.

Tory is by some supposed to have been derived from the Irish *foory*, applied to beggars and outlaws. Others think it most probably derived from *tar*, the Irish for *bush;* implying that the *Tories* were wild and uneducated, and lived in the woods; and others still from *Tara-ri*, pronounced tory, and meaning 'Come, O King!' an exclamation much used by the Irish adherents of Charles II. The latter is most probably the true origin of the word.

These terms were introduced into this country during the Revolutionary War, and were applied respectively to those who favored the popular movement, and those who ordered to the King.

The word *Radical* arose about the year 1818, and *Conservative* about 1830.

The term *Cabal* was first prominently employed, in a political sense, during the reign of Charles II. of England. The name was given to his ministry by the Opposition, or Tory interest, from the intriguing disposition which they claimed was characteristic of that ministry. It was doubtless all the more taking in the popular mind from the singular fact that the initial letters of the persons composing that body spelled the word. The names were Clifford, Ashley, Buckingham, Arlington, and Lauderdale—CABAL.

The real origin of the term is doubtless the Spanish term *Cabala*, a club, or society, implying a secret organization for intriguing purposes. It is synonymous with *faction*, a body of men less than a *party*, having for their object the overthrow of an existing party, or the foundation of a new one.

Franklin and his Gig.—It is now more than a century since Benjamin Franklin, Postmaster-General of the American Colonies, by appointment of the Crown, set out in his old gig to make an official inspection of the principal routes. It is about ninety years since he held the same office under authority from Congress, and when a small folio (still preserved in the Department at Washington), containing but three quires of paper, lasted as his account-book for two years. If a Postmaster-General now were to undertake to pass over all the established routes, it would take six years of incessant railroad travel, at the rate of one hundred and twenty miles daily; while if he were to undertake the job in an "old gig," he would require a lifetime for its performance. Instead of a small folio, with its three quires of paper, the Postoffice accounts consume every two years three thousand of the largest ledgers, keeping upwards of a hundred clerks constantly employed in recording transactions with more than thirty thousand contractors and other persons.

A Model State.—The Vermonters used to be proud of their State, and we hope that the following picture of it, drawn by the Rutland *Herald*, a few years ago, is still true: "There is but one city in the States, and not one soldier. We have no theaters nor mobs. We have no police, and not a murder has been committed in this State for the last ten years. We have no museums, opera houses nor crystal palaces; but we have homes, that are the center of the world to their inmates, for which the father works votes and talks; where the mother controls, educates, labors and loves; where she rears men, scholars and patriots.

MINING AND SCIENTIFIC PRESS

PATENT AGENCY.

For the Pacific Coast.

Office of the Mining and Scientific Press—No. 505 Clay street, corner of Sansome, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington.

The first question that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his secret to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the Mining and Scientific Press. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $25. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of governments that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, procuring it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we cause thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, our Washington agent has access to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to obtain their prospects of success by further efforts, are invited to avail themselves of our uncqualled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimentions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: Dewey & Co., Mining and Scientific Press, No. 505 Clay Street, corner of Sansome, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first instalment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance.

The following is the Government tariff of fees established by law:

On every application for a design, for 3 y'rs and 6 mos...	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years....	30
On every application for a patent, for seventeen years...	15
On every caveat.....	10
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C....	25

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

N. B.—We make out our own forms for applications, etc., and would respectfully inform all parties that we have no printed blank forms for sale.

Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer apolicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

Mr. Wm. R. Brndshaw, is our Special Correspondent and Traveling Agent. All favors or assistance rendered him in his progress through the country in behalf of our journal, will be duly acknowledged.

SAN FRANCISCO, Jan 1st, 1866.

Mr. A. C. Knox, is our fully authorized Traveling Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.

SAN FRANCISCO, Jan 11th, 1866.

Mr. Elwin Davis, is authorized to solicit subscriptions, advertising, etc., for the MINING AND SCIENTIFIC PRESS, in San Francisco, and to receipt for the same.

San Francisco:
Saturday Morning, Mar. 10, 1866.

Endorsement by the Miners' State Convention.

The following resolution was adopted by the California Miners' State Convention, held at Sacramento, Jan. 17th, 1866:

Resolved, That we regard a mining paper or journal of great importance to the mining interest of California, and we recommend the MINING AND SCIENTIFIC PRESS, of San Francisco, to the consideration and support of the miners of the Pacific coast.

IMPROVEMENT IN MINING STOCKS.—We would refer our readers to the stock report, which will be found in our columns this morning. It will be observed that the mining share market has been characterized with a greater degree of activity than has been witnessed for many months past. An extraordinary advance will be noticed in some particular shares, and quite a marked improvement in many others. It is gratifying, moreover, to be able to state that the impression prevails that this improvement is not due to any "hulling" scheme, but to actual improvements in the mines themselves. For some time past discoveries of a most encouraging character have been almost weekly made all along the line of the Comstock lode; one of the latest and most important of which has been announced the past week in the Ophir. This strike has been made in the ninth level, at a point about 200 feet south and west from the Mexican shaft, and 75 feet north of the Central company's line, where a vein of very rich ore is said to have been found fifteen or twenty feet thick. This discovery accounts for the sudden advance in the shares of this mine the past week, from $430 to $800; although they subsequently fell to $740, which was the closing figure at yesterday's Board. These successes will bring about a resumption of work on many of the abandoned claims along the Comstock, and give promise of unusual animation for the coming season.

IMPORTANT OIL STRIKE.—We understand the Bennett Well, on Corte Madera creek, San Mateo county, commenced overflowing with water and oil on the 27th ult. It was still flowing up to last accounts, a week afterwards. The amount of oil coming over was quite small, however, not more than two barrels a day; but quite enough to afford much encouragement to the proprietors of oil property all through that section. The well is only 104 feet deep. The oil is of a very excellent quality, and burns quite freely in its natural state.

ABOUT the 15th of March six Concord coaches will leave Virginia City, Nevada, for Virginia City, Montana.

A NEW EARTH PULVERIZER.

Messrs. Fithian & Young, of Joliet, Ill., have recently invented and patented an important improvement in the plow, which is being received with high favor among scientific agriculturists at the East. It is called the Rotary Plow, or Earth Pulverizer. The main advantages gained by this, over the plows generally in use, are: 1st. The manner in which the soil is turned over. This is accomplished by a *lifting* cut, in such a manner that the plow does not bear an ounce on the subsoil; while those generally in use act like a wedge—pressing down with the same force as that applied to lifting up, and thereby ironing down the subsoil, as it were. 2. Stopping of its pores, and thereby greatly diminishing the tendency of the water to work its way upward when the dry season approaches. This is an evil entirely overcome by this machine, which is so constructed that the revolving cutters strike the ground very much as a horse's hoof strikes it when he is pulling hard; but instead of coming down subsequently with the heel, the foot must be supposed to continue a revolving motion, which of course would lift up whatever ground it took hold of.

3d. The machine effects a most perfect pulverization of the ground after it is so lifted up. This part of the work is accomplished by a series of revolving knives, which are made to pass rapidly through the soil, they also giving a lifting cut, and dividing it up into the thinest possible slices—so fine that it is completely pulverized, as is sometimes done by chopping it up with a hoe. The operation of this machine, however, does it much more perfectly than it can be done with a hoe, at the expense of almost any amount of time. Some idea of what is done may be inferred from the fact that the gearing is so arranged that with the horses walking two and a half miles per hour, there are over 3,000 of these knives passing through the ground every minute. The ground is said to be left as though it had been picked up and sifted over the earth! It is claimed that with this machine one man and four horses will do as much work as five men with five plows and ten horses can do with the ordinary plow, to say nothing about the subsequent pulverization required. We shall soon be able to give an illustration and more particular description of this machine, which is now about to be introduced into California.

ANOTHER PADDLE WHEEL.—Adolph Heuston, an ingenious mechanic of this city, has invented what he calls "Heuston's Self-Feathering Paddle Wheel," for use upon steamers. The feathering of the paddles is effected by a very simple contrivance, consisting of a lever working solely by the power of gravitation, which locks and unlocks the bucket as the wheel revolves, each paddle working independently of the others. The invention has been tried upon a four-foot model, and worked to the satisfaction of several competent mechanics and scientific men who witnessed the trial. A model of the invention is on exhibition at the Merchants' Exchange, for the inspection of steamboat men and others interested in such matters. A patent has been applied for.

THE SCREW PADDLE-WHEEL.—A United States patent has been granted for this valuable California invention, and we are informed that the wheel will be speedily tested on a large scale, both here and in the harbor of New York. The convictions we have heretofore expressed as to the novelty and value of this device have been fully confirmed by the award of letters patent by the Governments of England, France, and several other foreign Governments, and the theory of the inventor seems to have been thoroughly vindicated by all the tests hitherto made. In behalf of the interests of navigation, we ardently hope its practical working, on a large scale, may realize the most sanguine expectations of the proprietors as well as the predictions of its friends. A model of the invention may be seen at the office of E. C. McComb, No. 1 Government House, in this city.

A NEW AMALGAMATOR.—Mr. Andrew Hunter, of this city, well known as the inventor of a very excellent grain separator, and a concentrater for saving sulphurets, has recently perfected still another invention, to be employed in amalgamating the precious metals. It is so constructed as to be worked in charges, combining the purposes of an amalgamator and concentrator; or it may be worked continuously, as an amalgamator alone; receiving the sand direct from the batteries, and discharging automically.

The machine consists of a square wooden box, with sides as high as may be desirable. The floor is composed of oak or any other hard wood, sawed into blocks, and set upon end. Upon this floor, and attached to suitable supports, is arranged a series of rubbers, shod with iron and working back and forth with an oscillating motion, making about sixty vibrations per minute. By this rubbing motion the particles of gold receive a slight trituration, which tends to remove any impurities which may have accumulated upon them, to the hindrance of their free amalgamation with the quicksilver. All miners who have been accustomed to collecting free gold by using quicksilver in a pan, are aware of the great advantage, and, at times, absolute necessity of using the hand to rub the gold about in the quicksilver to make it amalgamate. The design of this machine is to make that operation continuous, and by it every particle of the pulp, as it comes from the stamps, is made to pass in succession under a series of these rubbers, which may continue *ad libitum*.

A working model has been set up in this city and submitted to the inspection of quite a number of practical miners, who have expressed very favorable opinions of it. Mr. Hunter is now in Grass Valley, where he has a contract for putting up one or more of them at one of the quartz mills in that place. When the machine is put into practical operation we shall report with regard to its success.

MORE MINING SALES IN GRASS VALLEY.—We understand that a one-fourth interest in the Ione claim, to which we alluded, editorally last week, and which is located about two miles from Grass Valley, near Payne's ranch, has been sold within a few days for the sum of $50,000, to Louis Sloss & Co., of this city. This mine has been promising very finely, and a short time ago gave the most unmistakable evidences of great richness.

The Grass Valley *Union* of March 2nd says that Mr. Gerstler, the day before, concluded the purchase of the Union Jack mine. This mine is a western extension of the Ione. This purchase was also made for Messrs. Sloss & Co., at a cost of $50,000. The late owners of this valuable claim were Con. Reilly, Martin Ford, Dave Watt, Pat Lee, Frank Morse, James Mason, A. Salaman, J. L. Sykes, of Grass Valley, and Wm. Alvord, of San Francisco. The Union Jack is a well developed mine, and the purchasers no doubt have an excellent thing.

ARTESIAN WELLS CONDEMNED.—The San Jose *Mercury* says the great number of flowing artesian wells in and about San Jose have completely dried and rendered worthless hundreds of acres of laguna lands in the southern portion of the county. Owners of these lands begin to complain at this trespass on the part of the wells, and it is proposed to divert the waters of Cayote Creek to the lagunas, which will furnish an inexhaustible supply for the lands in question as well as for the artesian wells.

PATENT ALLOWED.—Mr. J. Hendy, of this city, has received notice from the Commissioners of Patents, at Washington, that letters patent for improvements on the Prater Concentrator have been allowed him. These improvements were fully described and illustrated in our issue of February 3d.

REESE RIVER BULLION.—Night before last, says the Virginia *Enterprise* of March 2d, sixteen bars of bullion from Reese River, valued at $13,542, arrived in that city. The bullion was taken from the Savage mine, near Austin.

ANTHRACITE COAL.—The steamer Labouchere, which arrived at this port, yesterday morning, from Victoria, brought 105 sacks of coal from the anthracite coal mine, lately opened by the Queen Charlotte Company. This coal is pronounced fully equal to the best Pennsylvania anthracite for foundry purposes. Persons having a curiosity to examine the coal will probably find it on Market street wharf today, where the steamer is discharging. The company will soon commence making regular shipments to this city. There are two mines already opened, and a full cargo may be expected within three months. A full description of this coal, with an analysis of it, was given in the MINING AND SCIENTIFIC PRESS of September 18th, 1865.

DISCOVERY OF PLACER DIGGINGS IN LOWER CALIFORNIA.—A correspondent of the *Alta*, writing from La Paz under date of the 14th ult., says there is a little excitement in that neighborhood in the way of placer gold diggings, which have been discovered some miles south of the San Antonio and Triunfo silver districts. A number of sluices have been constructed, and sufficient gold to pay $4 and $5 per day to the man. The diggings as far as discovered, cover an area of forty square miles. Water is yet scarce, but it will be brought to the place if gold is as abundant as some persons believe. The general appearance of the district is very similar to that of the auriferous hills of California. The silver mines show little change. If it were not for the war much would be done.

RICH STRIKE.—The Nevada *Transcript* of March 5th says: "Karney & Co., prospectors, have struck some rich rock on the third extension of the Star Spangled Banner ledge. The ground of these parties is located near where the lead crosses Little Deer Creek. They have only sunk a short distance, but the rock taken out is filled with free gold and rich looking sulphurets. They have a splendid prospect and a wide ledge, and there is no reason why their claim should not prove as rich as the Star Spangled Banner.

CENTRAL CITY, COLORADO.—A correspondent from Central City, inclosing his subscription for the PRESS, requests us to give a list of a few books most serviceable to miners, and which can be obtained in this city. For the benefit of our correspondent and others, we would name the following: Dana's Mineralogy; Makin's Manual of Metallurgy, (fully noticed in our last); Philip's Metallurgy; Overman's Metallurgy of Silver Ores and Silver Mines, by Prof. Blake; Kustel's Silver Processes of Nevada; Bodeman & Kerl's Assaying, translated by W. A. Goodyear, and Ure's Dictionary. Any of these works can be obtained in this city. For further reference we would call the attention of readers to Bancroft's catalogue of scientific books, advertised from week to week in this paper, and a copy of which will be mailed by Bancroft & Co., to any address upon application.

IONE, REESE RIVER.—A correspondent writing from Ione says that the mining prospects in that vicinity are now very flattering, and that the town is looking up for a bright future. A 20-stamp, first class quartz mill has recently been started, and a 10-stamp mill is well under way. It is in contemplation to put up quite a number of other mills next season. Our correspondent further adds that "The MINING AND SCIENTIFIC PRESS is growing in the estimation of our best informed men."

THE SPECIMENS OF ORE sent us by our correspondent from Monitor, Alpine county, do not appear to present anything especially unusual, unless it be the brightness of the oxide of iron with which they are coated. They will hardly warrant the trouble of an assay, and an analysis, even, would not be likely to develop anything of importance.

SOME very good ore has just been found in the Imperial mine, near the west casing, says the Virginia *Enterprise*. A 700-foot level will shortly be opened in the mine.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

San Francisco, Saturday Morning, March 10, 1866.

Capital is readily acceptable to borrowers in good credit at 1@1¼ ₱ cent. per month, and some important negotiations have been made this week upon still more favorable terms. The difficulty experienced in loaning funds to be employed for regular business purposes, and upon real estate and other collateral usually preferred by capitalists, has diverted some means hitherto idle into Stock channels since the late rise.

Receipts of Treasure from domestic sources, since the date of our last reference, amounted to some $1,200,000. During the same period, the Branch Mint in this city has taken $425,000 for coinage.

The supply of Bullion on the market is thought to be fully adequate to the wants of shippers, and owing to the low rates ruling in New York, Gold Bars have been in rather less active request at 840@850. Silver Bars, for refining purposes, have been sold as high as 2 ₱ cent. premium, but the current quotations at the close, for average grades are 1@1¼ ₱ cent. premium.

Currency Bills on the Atlantic are offered at 30 ₱ cent. premium on gold. Telegraphic transfers are made at 2¾ ₱ cent. premium, and Sight Drafts, payable in coin, are quotable at 2¾ ₱ cent. premium (including stamp). Sterling is selling at 48¼@48½d for best Bankers' Bills; Commercial at 49¼@49½d.

Legal Tender Notes have been inactive, but firmer at enhanced rates, and sales were made at 75½c, s 30, closing at 75¾c asked. Our latest telegraphic advices from New York quote Gold at about 132½.

The Share market has been characterized by unusual activity this week, and the recorded transactions at the Board show a larger weekly aggregate than for many months past. The present excitement upon the Stock exchange, the extraordinary advances in some shares, and the material improvement in others, have been occasioned solely by the very favorable developments made recently, and the discouraging views entertained by some croakers a short time since as to the waning productiveness of the Comstock lode, were not, it would seem, based upon sound premises, if its present appearance in certain localities affords any evidence of intrinsic value or future permanency.

Crown Point has been dealt in to the extent of 40 feet, advancing from $1,000 to $1,375, buyer 30; receding to $1,230, and closing at $1,325. During the week ending March 2d, 663 tons of ore were hoisted to the surface. In running some 20 feet south of the south incline on the 300-feet level, the ore is said to be improving in quality and quantity. A new body of ore was met with recently, in drifting west, some 30 feet above the lower level. This deposit is said to be 3½@4 feet wide, and promises to become a valuable addition to the resources of the mine. The aggregate receipts of Bullion last month amounted to $153,640.93, the ors reduced averaging $45.63 per ton. There is some talk of a dividend for the month of February.

Hale & Norcross receded from $1,200 to $1,040, rallied to 1,085, dropped to $1,050, then sold at $1,080, and closed at $1,075. No material change has taken place the past few days in the general character of the lode in the 700-feet level. Its width, as disclosed in the different cross-cuts, varies from 12 to 25 feet. Sinking has began for a new level below, and a drift is also under way across the 535-feet level, preparatory to sinking, with a view to connect that and the 700-feet level. The mine is now producing some 50 tone of ore per day, worth from $40 to $45 per ton; and receipts of Bullion this week have amounted to $14,000. A dividend is deemed probable for the current month.

Savage rose from $940 to $1,100, fell to $1,010, rallied to $1,070, buyer 30; then sold at $990, and closed at $1,040, b. 30—some 70 feet in all changing hands. The product of the mine is averaging about 65 tons of ore per day, and the total yield of Bullion last month exceeded $150,000. The last "clean-up" of 500 tons of ore at the Marysville mill averaged $54 per ton.

Gould & Curry advanced from $900 to $1,070, buyer 30, and closed at $1,010. There is no new feature in any portion of this claim. Little or no progress has been made recently in the exploration of the 2d Station, but drifting continues vigorously on the 4th.

Ophir has attracted decided attention this week, and nearly 600 feet changed hands, advancing from $430 to $770, receding to $700, rallying to $820, dropping to $750, and closing yesterday at $740. In drifting south and west, some 200 feet from the Mexican shaft, in the 9th Gallery, a very promising body of ore has been found. This deposit is about 75 feet north of the Central Line, and is said to show in the cross-cut a width of 15 feet.

Yellow Jacket has been active, and 170 feet were sold, rising from $420 to $510, receding to $470, then selling at $485, and closing at $525@500. Drifting continues from South shaft, and favorable indications have been met with this week.

Chollar-Potosi has been in some favor, and nearly 400 feet changed hands, advancing from $352 to $410, buyer 10; receding to $472, and selling yesterday at $362@380. The Piute Station of the Potosi is said to be looking better, and continues to turn out a large supply of ore. The stope over head of incline in the Bajazette Ground discloses an "enormous" body of low grade ore, which is being easily and cheaply mined. In the station 60 feet below Potosi Tunnel, some good ore has been found in the old drift, 70 feet south, and in the drift east the south end shows ore about 10 feet wide. The drift to the ledge from the new shaft is in 195 feet. During the week ending March 2d, 1,015½ tons of ore were sent to custom mills.

Alpha fell from $290 to $275, rose to $340, then sold at $305, and closed at $310. Belcher advanced from $225 to $300, then declined to $260, and selling yesterday at $275@280.

Empire Mill and Mining company is in much better favor, and small sales were made, advancing from $210 to $245, and closing at $245 bid. Some 1,500 tons of ore were raised to the surface last month, and about 1,200 tons were reduced, producing $36,000. During the past ten days a better quality of ore has been found. A dividend is anticipated for the month of March.

Imperial rose from $127.50 to $175, fell to $147, rallied to $150, and then sold at the close at $160. The aggregate receipts of Bullion last month amounted to $74,025.05. This company had a surplus on hand of some $30,000 at the beginning of the month, with an indebtedness of $4,000, maturing on the 28th instant. The Gold Hill mill has commenced to crush ore from the Holmes mine, and the Alta shaft is down, in all, some 90 feet.

Confidence rose from $70 to $85, fell to $70, rallied to $75, and closed at $75. Overman rose from $63 to $97, fell to $87, then advanced to $95, closing at $95. Bullion has been dealt in within a range of $60@86, closing at $80.

The aggregate recorded sales of Stocks, since Saturday last, amounted to $1,050,264.

To Printers.

We have for sale, at a bargain, a Second-hand Half-Medium (largest size), Ruggles' Engine Job-Printing Press, of most approved pattern. It is in excellent condition, and warranted to work as good as new. Apply soon, at the office of the Mining and Scientific Press. 19v11tf

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The Mining and Scientific Press Patent Agency has strictly complied with the requisitions of the Department, and properly files all necessary papers as Claim Agents.

DEWEY & CO., Proprietors.

Patent Agency and Job Printing Office, 505 Clay street, San Francisco. July 1 1865

Too True.—The following picture of the miner's life, by a letter writer who visited Virginia City the first of the month—pay-day—portrays in colors too true the end and aim of a large class of those who, though pioneers in discovering and invaluable as the bone and sinew to open and develop mines, are good for nothing to themselves, always drudging and always complaining of the hard fate meted out to them:

"Virginia is lively, the city is astir with busy life, and its pulses throb with feverish excitement—alarming fact but true, why? Every thirty days all the mines and mills of Storey county and adjacent burgs pay off their corps of employees, and for a few days thereafter whisky shops, hurdy-houses, theaters and red-curtained palaces thrive on the toil—strained gold of the "honest miner." Soon he gets broke, and until another thirty days roll around on heavy clogged wheels, the poor devil has only to work, work, work, and the city has only to wag, wag, wag, as slow as stages, until old gunny-sacks pays off the red-brawned muscle that makes a monthly fool of itself."

Professional Cards.

Our Patent Agency.

The Patent Agency of the Mining and Scientific Press has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of Letters Patent from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

To Mining Companies.

A GENTLEMAN OF MUCH EXPERIENCE AS A MINING Superintendent, in England, Spain, and on the Pacific coast, and one intimately acquainted with every department of mining, and with nearly every class of mineral, is desirous of securing a position as Superintendent of some mining operation in California or Nevada. The applicant was for four years Superintendent of the New Almaden Quicksilver Mine, in this State. The best of reference given on application at this office.

San Francisco, Oct. 12, 1865 .5v11tf

REMOVAL.

Informs his patrons that he has removed his DRAWING SCHOOL from Pine street to

410 Kearny Street.

Drawing Classes in the Evening will take place as usual. DRAWINGS FOR PATENTS accurately and neatly done. 20v11-1m

Volume Twelfth.—The Mining and Scientific Press, with its last issue, commenced its twelfth volume. Since Dewey & Co. have "held the ribbons" its gait has been rapid toward a perfect journal. Its appearance evidences its prosperity, but doubtless, like some of the rest of us, it can stand increased encouragement. Let such be given, and, our word for it, volume thirteen will acknowledge receipt.—[Golden Era.

Metallurgy.

MOSHEIMER'S CONCENTRATOR

RECEIVED THE FIRST PREMIUM

From the ROYAL POLYTECHNIC SOCIETY, in Cornwall, and was highly recommended by the Commissioners as the most Simple and Effective Concentrator for all kinds of Ores.

Every Quartz Mill ought to have them, as they not only save Gold and Silver, but also the Quicksilver and Sulphurets, without extra labor. They can be built entirely of wood at the mine, and will separate more perfectly in one operation, than any other Concentrator in use. Apply to

J. MOSHEIMER,

23v11qy 423 Washington street.

EUROPEAN

METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellous ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

Economy in Advertising.—The Mining and Scientific Press is the best and most economical mining advertising medium in this city. Our terms are less than one half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

A sweet little girl in New Haven, only three years old, was promised one evening that she should accompany her parents to Boston, the next morning. She was much elated at the prospect of the journey, and when she had finished repeating her little prayer, as she laid down to sleep, she said with the most exquisite simplicity, "Good by, God—good by, Jesus Christ—I am going to Boston in the morning!"

Hope writes the poetry of the boy; but memory that of the man. The boy looks forward with smiles; man looks backward with sighs. Let the young strive to so live that their cup of joy may continue full to the latest hour, to the end that the memory of manhood may be the least embittered with painful recollections.

A Lesson from the Flowers.—As flowers never put on their best clothes for Sunday, but wear their spotless raiment and exhale their odor every day; so let your life, free from stain, ever give forth the fragrance of goodness.

It is not the *height* to which men are raised, that so often makes them giddy, but it is *looking down* upon those below them.

He who is continually prating about the faults of others, generally finds but little time to think of his own.

A false friend is like a shadow on the sundial, appearing in *clear* weather, but vanishing as soon as it is *cloudy*.

Passionate persons are like men standing upon their heads, they see everything the wrong way.

Keep company with persons rather above than below yourself; for gold in the same pocket with silver always loses some of its color.

Relieve your own virtues, and by imitation naturalise those of others.

The love of society is natural; but the choice of our company is a matter of virtue and prudence.

Happy are those who can be pleased by trifles. What is our whole position but a composition of trifles.

Say nothing, do nothing, which a good mother would not approve, and you are on the certain road to happiness.

A Business Compliment.

Petalma, Oct. 4, 1865.

Messrs. Dewey & Co.—Gentlemen: Your note informing me that my patent for Crushing and Baling Machine is ordered to issue is at hand. Please accept my thanks for the prompt and business like manner with which the case has been conducted, and inclosed find twenty dollars for balance Government fees. Respectfully, etc.

JACOB PRICE.

Commencement of Twelfth Volume

—OF THE—

Mining and Scientific Press

Published Every Saturday.

The title of our journal is a truthful expression of its character.

It affords a class of progressive information to the Miners, Mechanics and Professional Men of the Pacific Coast, which cannot be derived from books, or other publications.

Each Volume comprises, in reality, a book of new intelligence and facts relating to Mining, Mechanism, Metallurgy, Science and Art, developed by our rich and peculiar resources, and identical with our own industry and history.

By the encouragement of intelligent economy in LABOR and GOLD-SAVING, we shall make the PRESS a source of INDIVIDUAL PROFIT to its patrons, as well as a public benefit to every local community in which it circulates.

The prospects of our journal are now brighter than at any former period. Our facilities for furnishing a valuable paper are constantly increasing.

Following are some of the many opinions generously expressed by our neighbors:

Editorial Expressions:

The publishers intend to make it the "Scientific American" of the Pacific Coast. Every miner should have a copy of it in his cabin, for it will be filled with useful information for the pick and shovel fraternity.—[Trinity Journal.

Should be taken by every man owning "feet" [and brains] in this State.—[Beacon.

In no other ten journals can the reader find the same amount of reliable mining news as in the PRESS.—[Contra Costa Gazette.

Every stockholder in different mines will find it will pay to take and read this mining journal.—[Contra Costa Gazette.

The PRESS is to the Pacific Coast what the "Scientific American" is on the Atlantic. It deserves its success.—[Aurora Daily Times.

It is fully up to the times, and furnishes the latest mining improvements and intelligence.—[Calaveras Chronicle.

Every miner should subscribe for the PRESS.—[Calaveras Chronicle.

It presents a channel through which all mining notices may be cheaply consolidated into one sheet for the convenience of all stockholders.—[Mountain Messenger.

We can give our testimony that it is always replete with useful and valuable information to miners and mechanics. [Placer Herald.

It contains correspondence from different sections, giving accounts of new discoveries in gold, silver and copper, and should be taken by every person that wishes to keep well posted on the developments of our State and the Territories.—[Mountain Messenger.

With the last number is an index to the whole volume, most useful and valuable to those who keep files of that paper.—[Shasta Courier.

Prof. J. D. Whitney's address on Mining, is given entire. * * * We preserve the PRESS, and would like to have a full file.—[Napa Reporter.

The public should support the enterprise of the MINING PRESS, one of the best papers in the State, by a liberal patronage, as it is only by a system of legitimate reports that our mines can be favorably brought before men of capital below.—[Calaveras Chronicle.

Under the management of Messrs. Dewey & Co., the PRESS has been much improved in every respect. * * It deserves a liberal support.—[Virginia Union.

A good paper for this country.—[Humboldt Register, Ne.

Those who would have a good paper of this character, should subscribe now.—[Marysville Appeal.

It embraces one of the finest fields in the world, and seems to improve it. * * * It will be second to no scientific record now published on this continent.—[Los Angeles News.

A neat and useful journal. One of the most presentable and useful in the State.—[Sunday Mercury.

Such a journal has been needed on the Pacific Coast. The PRESS fills the bill.—[Reese River Reveille.

A splendid paper, and should have a good list of subscribers in prosperous Grass Valley.—[G. V. National.

We receive, regularly as clock work, this exceedingly valuable and interesting journal.—[Napa Reporter.

Interesting and important to miners and Mountain men. [Butte Record.

Friends pleased with our efforts in the publication of the PRESS can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

Oakland Water-Cure.

APRIL 1ST, 1864, WE OPENED A HYGIENIC BOARDING House and Ladies' Health Institute in Oakland. The great advantage we have experienced since that time, in the treatment and cure of all those diseases peculiar to females, as well as those common to all, over that of San Francisco, induced us to give up the treatment of gentlemen in the city. We have accordingly removed our entire Bathing, Electro-magnetic, and Gymnastic Apparatus, which we used especially in the treatment of males, to our Health Institute across the Bay, and have found, after a trial of seven months, that gentlemen as well as lady patients recover, at our Fountain Farm Cure, one-third faster than in the city of San Francisco. The climate here is the most even and bracing to be found in the State. The grounds command a view unsurpassed in the world. The Institution is furnished with an abundance of pure, soft water, from numerous springs; and we now offer to Ministers, Teachers, Lawyers, Miners, Merchants, Mechanics, Farmers, and all other worthy persons, who desire to try the advantage of the only *rational* system of medicine, the hospitalities of our Home and Cure. Young men who have become debilitated or lost their health by excessive toil, exposure, or enervating habits, contracted through ignorance of Physical Laws, may with us find more of the encouragements they need, and means that will restore them to health, than elsewhere in California.

We claim for Water-Cure and Hygienic Medication superior advantages over all systems of drug medication in the cure of all disorders, whether acute or chronic; that its followed by none of those debilitating diseases such as Piles, Chronic Diarrhœa, Torpid Liver, Constipation, Intense Nervousness, Neuralgia, etc., nor those terrible Secondary Diseases, known as Varicose Swelling of the Veins, Necrosis, or Decaying of the Bones, Ulceration of the Limbs, Mercurial Rheumatism, Urethal Strictures, etc., which we well know result from the free use of mercury and other metallic drugs, together with stimulants and vegetable poisons given to overcome acute diseases.

The Oakland Water-Cure and Eye Infirmary is by far the most complete in its facilities for the cure of all diseases commonly treated in all Eastern Water Cures of any like establishment on this coast, and the only one in California conducted according to the Theory and Practice of the New York Hydropathic College. We use all forms of Warm and Cold Wet Sheet Packs, the Electro-Chemical Bath, Steam Baths, Improved Sitz Baths, Douche Baths, a Patent Spray Bath, and Magic Baths. The last named was instituted by Dr. Smith with special reference to the cure of those diseases peculiar to males, namely: Rheumatism, Inflammatory or Chronic, Stiff Joints, Paralysis, Mercurial, Lead, and Oak Poisonings. It is a sure cure for Ague and Fever. It aids more than any other Bath we have yet used in eradicating all kinds of drugs and infectious poisons, and in the cure of all disorders induced by exposure to dampness and water, foul air, absence of light and electricity, retorting metals, the malaria of rivers and low marshy grounds. Where there was a fair constitution left, even when drugs had been applied for months and years without a cure, we have, in the past seven years, treated successfully the following diseases: Chronic, Inflammatory and Mercurial Rheumatism; Paralysis; Lung, Bronchial and Catarrhal Affections; Diseases of the Heart, Kidneys, Liver; Dyspepsia, Constipation, Scrofula, Piles, Inflammation of the Bowels, Chronic and Acute Diarrhœa, and all diseases and weaknesses peculiar to male and females. No physician in California is so favorably situated to furnish so many home comforts and hygienic conditions that are indispensable to the speedy recovery of nervous and chronic invalids. We have the only truly healthful boarding place in the State for men, women and children, with plenty of saddle and carriage horses for the use of patients and boarders.

To that class of Diseases and Weaknesses peculiar to females, and the medication that Hydropathic or Hygienic physicians employ in their cure, do we invite the special attention of patients and their friends. The ease and rapidity with which females suffering from general or special debility, recover in the bracing climate of the Bay, under Hygienic Medication, together with the universal success that has attended the treatment of females at Dr. Smith's Institution in San Francisco, induced us to establish and has induced us to make this class of human afflictions a specialty of our Insitution. We have treated (mostly in the cure), over 300 females, several of whom had been "bedridden" for months and years, and all have been decidedly benefited, with but few exceptions, returned to their homes in from two to six weeks, so far recovered as no longer to need a physician. We have never yet learned of a single instance of a relapse into their former condition.

There is not one female invalid in twenty that has been suffering from nervous debility or diseases peculiar to her sex, that cannot be permanently cured by spending from four to six weeks at our Cure, and at the mere cost of $100. This statement we make in confidence, from an experience of the last seven years. From the many who have been treated at our Cure, we have yet to learn of a single regret from husband or wife of the time or means they have expended in Hygienic Medication.

NEW YORK, Aug. 1, 1858.

To all whom it may concern:

This certifies, that Dr. Barlow J. Smith is a graduate of the New York Hygieo-Therapeutic College, which College has a regular Charter from the Legislature of the State of New York, and is authorized to grant Diplomas, conferring on its students all and the same privileges and immunities in relation to the practice of the Healing Art, that are conferred by the Diplomas of any Allopathic or other Medical College in the country.

Dr. Smith has also devoted much attention to Phrenology, especially in its connection with Physiology and Pathology, a portion of the time under the instruction of Fowler & Wells, of this city, and has found successfully as a teacher and lecturer on these subjects.

R. T. TRALL,
Principal New York Hygieo-Therapeutic College.

To all whom it may concern:

I have known Dr Barlow J. Smith, both in our office as a Student, and a practical Phrenologist in the country, and from what I know of him I can cheerfully recommend him as an honest, faithful, skillful man of character, and as such can cheerfully recommend him to the public.

For the good of Science.
L. N. FOWLER, 308 Broadway, N. Y.

Dr. Smith spends a part of each day in San Francisco, attending to family practice and to Phrenological and Physiological examinations at his office, Room 13 Armory Hall, up stairs, corner Montgomery and Sacramento streets. Office hours from 11 A. M. to 2 P. M. Circulars sent on application. Address,

BARLOW J. SMITH, M. D.,
20v11tf San Francisco, Box 473.

HENDY'S
IMPROVED BLOW-PIPE.
This Convenient Helpmeet

—TO THE—

ASSAYER, CHEMIST, DENTIST, JEWELLER, PROSPECTOR AND MILLMAN,

Can now be procured, at the Patentee's price, by sending your orders, by mail or otherwise, to the

Office of the Mining and Scientific Press.

This article was more fully mentioned in the PRESS of April 15th, 1865. Since that time, however, Mr. Hendy has made a further improvement by attaching a rubber hose between the mouth-piece and the pipe, enabling the blower to change his position without disturbing the direction or constant accuracy of the current on the object upon which it is turned. The main portion of the blow-pipe is made with a joint, at which a valve is placed, which is opened when the operator blows and closed immediately when he ceases. By this arrangement the little bag or bladder is readily filled at a single breath, and with very little exertion. When so filled, a continuous current of air is forced from the nozzle of the pipe by the mere contractive force of the gutta percha. This force is uniform until the air is very nearly exhausted. The current may be easily varied or entirely cut off by gently pressing the fingers upon the neck of the bladder above the nipple to which it is attached.

Price, Complete.....$5.00.

1852 1866

A NEW VOLUME.

Fourteenth Year of Publication.

THE GOLDEN ERA.

FOUNDED IN 1852.

The oldest weekly paper in the State, permanently established, and more widely circulated at home and abroad, than any other paper on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents and contributors of distinguished ability in New York, Paris and London.

Miss BRADDON'S greatest Sensation Story, published from advance sheets:

RUPERT GODWIN;

—OR—

THE SECRET OF WILMINDON HALL.

A NOVEL.—BY MISS M. E. BRADDON,

Author of "Lady Audley's Secret," "The Outcasts," "The Doctor's Wife," "Three Times Dead," etc.

—IN—

THE GOLDEN ERA.

NOW IS THE TIME TO SUBSCRIBE!

Opinions of the Press:

THE GOLDEN ERA.—We would call the attention of all newly-arrived Californians to this excellent weekly cotemporary. We have seen the Era so frequently at the family fireside, and in the rude cabins of many industrious miners, that it would seem superfluous to recommend it to old Californians. It is the oldest literary journal on the coast. [S. F. Mining and Scientific Press.

THE GOLDEN ERA, which has just entered upon its fourteenth volume, is fully entitled to be considered as THE literary paper of the Pacific coast. Its proprietors understand the wants of the community, and furnish their readers with all the popular works of fiction as fast as the proof sheets are received from the Eastern States and Europe, and with a greater variety of original matter in the line of light literature, than can be found in any similar paper on the continent.—[S. F. Alta California.

THE GOLDEN ERA has entered upon its fourteenth year of publication. How many competitors for public favor have been started during this time, and not possessing the freshness and originality of the GOLDEN ERA, have struggled through a short, sickly existence—at last to "flicker out"—almost unnoticed. No single paper in the State is more read and admired, and friends in the States appreciate it fully as highly as the thousands here who weekly scan its columns. It is no copyist, being in all its main features Californian, and unlike the "story papers" in general, its contents are interesting to all who take an interest in the literature of this coast.—[Napa Reporter.

THE GOLDEN ERA, as a good family paper, as a literary production, cannot be surpassed within the limits of America, and America heats the world in publication of first-rate literary papers. It is filled to overflowing with excellent reading matter, original and selected prose and poetry. It is now publishing, from advance sheets furnished from New York, two very interesting stories, each chapter of which is alone worth the subscription price of the GOLDEN ERA.—[Folsom Telegraph.

THE GOLDEN ERA is decidedly the best journal of the kind on this coast, and, we had almost said, in the United States. It is prepared with great care and labor, and publishes an immense amount of reading matter. The serial stories of the best authors are printed in its columns, and its local gossip is always pungent, racy and instructive.—[S. F. Examiner.

THE GOLDEN ERA is one of the best journals of its class in the whole country, and is carefully and intelligently conducted.—[S. F. American Flag.

THE GOLDEN ERA is enlarged by the addition of eight columns of reading matter. It was never more worthy the support of the reading public than at present.—[S. F. Morning Call.

THE GOLDEN ERA is decidedly the best family paper published in the State and we are pleased to learn that it is in a flourishing condition.—[Sacramento Bee.

THE GOLDEN ERA, as a strictly literary and news paper, is chief among the best. Its correspondence and editorials are of that originality of style so peculiar to this coast.—[Oregon Sentinel.

THE GOLDEN ERA is the best literary paper published on this coast. It abounds in stories both real and fictitious, which are worth a careful perusal by every one.—[Santa Cruz Sentinel.

THE GOLDEN ERA is as good a literary paper as can be procured on the continent.—[Red Bluff Independent.

THE GOLDEN ERA has entered upon its fourteenth volume. It is by far the best literary and family paper ever published on this coast.—[Sonoma Democrat.

THE GOLDEN ERA is a most ably conducted literary journal, in every way worthy of its large circulation, and characterized by a flow of wit and freshness of satire in dealing with the prominent follies of the age that is truly refreshing.—[Deseret News, Salt Lake City.

THE GOLDEN ERA is a fine family and literary paper, as the broad Union anywhere can boast of.—[Denver Rocky Mountain News.

THE GOLDEN ERA is the best family journal in the United States.—[Salt Lake City Telegraph.

THE GOLDEN ERA is a highly handsome quarto of fifty-six columns, comprising the freshest and the richest cream of American belles lettres. Nothing north or south, or east or west, can be compared to it as an elegant family and literary newspaper.—[Union Vedette, Salt Lake City.

THE GOLDEN ERA, instead of economizing during these dull times and presenting a paper to match the times, is as brilliant as ever. It has a talented corps of literateurs, and keeps fully up to the mark.—[S. F. Dramatic Chron.

THE GOLDEN ERA is now in its fourteenth year of publication, and is established on a firm basis. It has a larger number of regular contributors, and gives a greater variety of reading matter than any other paper of the kind published in San Francisco.—[Quincy Union.

THE GOLDEN ERA has commenced its fourteenth year with a steady improvement in literary and typographical appearance.—[Yreka Journal.

THE GOLDEN ERA began in the infancy of the State, and has grown with it, until there is now hardly a post office in the State, or on this coast, where it is not taken. It employs the best writers in the Atlantic States, in Europe, and in California.—[Colusa Sun.

And in accordance with law, and an order of the Board of Trustees, made on the 31st day of January, 1866, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., at No. 626 Montgomery street, San Francisco, Cal., on Monday, the 19th day of March, 1866, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

CHARLES E. ABBOT, Secretary.

Office, 537 Washington street, Room 3, San Francisco, California. mar3

By Express.—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co.'s tariff) on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must themselves settle the same.

Money by Mail.—Subscribers and advertisers remitting us money in less sums than $50, can do so by mail at our risk, if they will register their letters; we will take no risk on unregistered letters, or letters by express. Remittances by express must be prepaid.

George Washington Gold and Silver Mining Company, Silver Mountain District, Alpine County, Cal. Assessment No. 10.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 20th day of February, 1866, an assessment of one dollar and fifty cents ($1.50) per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, only.

Any stock upon which said assessment shall remain unpaid on Saturday, the 24th day of March, 1866, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Tuesday, the 10th day of April, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

W. D. ROOT, Secretary.

Office, 338 Montgomery street, San Francisco.

Notice.—By an order of the Board of Trustees, made in the above Company, all the Certificates of Shares outstanding of the old stock are annulled, and have been replaced by issues of Certificates of the new stock, and parties are cautioned against purchasing any of the old Certificates, as they are all cancelled on the books of the Company, and all transfer of the same stopped.

feb24 W. D. ROOT,

Hancock Copper Mining Company, Low Divide District, Del Norte county, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 1st day of March, 1866, an assessment of fifteen cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Saturday, the 31st day of March, 1866, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 14th day of April, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

W. L. GETCHELL, Secretary.

Office, No. 19 First street, San Francisco, Cal. ma3

Julia Gold and Silver Mining Company, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 1st day of March, 1866, an assessment of one dollar per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Saturday, the 31st day of March, 1866, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 16th day of April, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

A. NOEL, Secretary.

Office, 607 Washington street, San Francisco, Cal. mar3

And in accordance with law, and an order of the Board of Trustees, made on the 29th day of January, 1866, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., at No. 626 Montgomery street, on the 20th day of March, 1866, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

G. M. BURNHAM, Secretary pro tem.

Office, 436 Jackson street, San Francisco. mar3

Keokuk Gold, Silver and Copper Mining Company, Clayton District, Contra Costa County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 14th day of February, 1866, an assessment of ten (10) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Saturday, the 17th day of March, 1866, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 31st day of March, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

A. B. WINEGAR, Secretary.

Office, 306 and 310 Front Street, San Francisco. feb17

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alterations which they may desire made in their advertisements at their earliest convenience. New advertisements should be sent in as early as possible.

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three month's delay requisite in transacting business through Eastern agencies.

Lady of the Lake Gold and Silver Mining Company, San Francisco District, Mohave County, Arizona Territory.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 1st day of February, 1866, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
A F W Thompson	119	20	$10 00
W J Leland	56	25	12 50

And in accordance with law and an order of the Board of Trustees, made on the 1st day of February, 1866, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the Office of the Company, on the 19th day of March, 1866, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

Constitution and By-Laws
—OF—
Mining and Prospecting Companies

Elegantly printed, with care and dispatch, at the office of the **Mining and Scientific Press.**

☞ Orders from the interior faithfully attended to.

Engraved to Order.—Persons who desire to illustrate their individual establishments or business, should give us their orders for Engraving and Printing, and we will guarantee good work and reasonable prices.

DEWEY & CO.,
Patent Agents, Publishers and Job Printers, 605 Clay st

Keep a list of your friends; and let God be the first in the list however long it may be.

Keep a list of the gifts you get; and let Christ who is the unspeakable gift he the first.

Keep a list of your mercies, and let pardon and life stand at the head.

Keep a list of your joys; and let the joy unspeakable and full of glory he first.

Keep a list of your hopes; and let the hope of glory he foremost.

Keep a list of your sorrows; and let sorrow for sin he foremost.

Keep a list of your enemies; and however many there may he, put down the "old man," and the "old serpent" first.

Keep a list of your sins; and let the sin of unbelief he set down as the first and worst of all.

SINGING.—Singing is a great "institution.' It oils the wheels of care, and supplies the place of sunshine. A man who sings has a good heart. Such a man not only works more willingly, hut he works more constantly. A singing cohbler will earn as much again money as a cordwainer who gives away to low spirits and indigestion. Avaracious men never sing. The man who attacks singing throws a stone at the head of hilarity, and would if he could, rob June of its roses and August of its meadow larks. Singing promotes health, strengthens the voice, the organs of the throat and lungs, and prevents or cures consumption.

MANNERS are more esteemed in society than virtues; though the one is artificial, like false brilliants, and the other pure, like real jewels.

A FASHIONABLE opera cloak costs as much in New York, as a farm in Illinois.

J. B. CONE, BUSINESS AGENCY.—Makes private sales of Property sud Business Places of every description, iu the city and throughout the State; procures partners with large and small amounts of money; negotiates sales o mining property, and does a General Agency Business. Patronage solicited by mail, express, or by personal application at the office, 402 Montgomery Street, San Francisco, California. 23v11tf

FOR SALE.

Owiag to the great distance from our point of manufacture, we offer for sale the State Right of California for our

Patent Boring Tools for Artesian Wells,

Illustrated upon the first page of this paper February 17th. These Tools are now in use in the various Oil Regions of Pennsylvania, Ohio and Virvlaia; and although but just introduced, are universally approved and admired, and hid fair to become eventually the most popular tools in use. We shall close without reserve to the party sending us the highest bid, to whom we will mail a complete set of Drawings, copy of Circulars, etc.

Address, fully,

A. A. WILSON,
Morgan Iron Works,
7v12tf Foot 9th street, East River, New York City.

GEORGE E. BROWN,

(Late Assistant Examiner in the U. S. Patent Office,)

HAVING RESIGNED THAT POSITION AFTER A TENure of office of eighteen months, offers his services to

INVENTORS AND THEIR ASSIGNEES,

—AS A—

Patent Solicitor,

He will make Preliminary Examinations in the Patent Office, with a view to ascertain the Patentability of any invention that may be submitted to him for that purpose; will prepare the necessary papers for those who wish to make Applications for

Patents for their Inventions,

—OR FOR—

EXTENSIONS OR REISSUES OF PATENTS

Already granted; will act as an Attorney in presenting Applications at the Patent Office, and in managing them to a final issue; will draw up Assignments; will examine into the condition of Rejected Applications when desired to do so, and undertake the prosecution of such as may be considered patentable, and do whatever else is usually done by Patent Solicitors.

Address, P. O. Box 257, Washington, D. C. 7v12-3m

RUGGLES' PRINTING PRESS

For Sale or Exchange.

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and *o*, Openings,

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing eveuness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,
WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

THE PRESS is a large, sixteen-page paper, and is truly a valuable assistant to the mining interests of the Pacific Coast.—[Nye County News.

"I'm Going Home, Mother," said a little boy who was about to die at Messilla. What sweet words he spoke! How grandly their echoes must have played along the walls of angel-chambers! Such geotleness and purity of spirit as that child possessed are transcendent. Such tenderness of soul, such hope, such desire, have never been mentioned in the pathetic stories of those who died of love. Men have expired while speaking words of sublimest import, words carrying thoughts into the world as imperishable as its highest hills! The great and heroic have stepped into the invisible existence without regret or fear; the Christian has rejoiced at the coming of the final hour, and martyrs have perished, calmly asserting their unchangeable faith, and patriots have answered death strokes with a defiant laugh, and scaffold victims and self-destroyers have ceased to breathe without a murmur or a sigh. But all the instances of heroism, all the shining heart sacrifices, all the mysterious alliances of the mortal and the spiritual are dim when near the soul splendor of the child dying to see his mother! The powerful are weak, the great become less, the brave lose their prominence in the vast aggregate of men, and all of mortal grandeur loses beauty beside that young passion-flower, that little sensitive plant in the devastated garden of life.—*McDonald.*

Arrogance can neither supply the want of talents, nor adorn them when possessed.

By Mail.—The Mining and Scientific Press will be sent by mail to any part of the civilized world. In case of removal, subscribers have only to inform us of the post-office address of their old and new location, and the paper will be sent accordingly.

BACK VOLUMES.

Machinery.

HUNTER'S

PREMIUM

CONCENTRATOR, AMALGAMATOR

AND SEPARATOR,

Awarded a Silver Medal at the late Mechanics' Fair.

Hunter's Concentrator can be seen in operation daily at the Novelty Iron Works, Fremont street. Parties wishing to purchase Concentrators will find it to their advantage to examine the above machine before purchasing elsewhere, for the following reasons:

1st. It will work the sands from a 5-stamp battery, and save from 10 to 20 per cent. more sulphurets than any machine built on the Pacific coast.

2d. The Sulphurets are washed clean, containing less than ten per cent. of sand.

3d. The waste free gold and amalgam is amalgamated on the copper plates; not a cake of ground mercury and scarcely a trace of metal passes off with the sand.

4th. Its simplicity is a sufficient recommendation for its general use as a Concentrator. The variation of speed in a Quartz Mill does not affect the working of the Machine. The same was demonstrated at the late Mechanics' Fair, when with the greatest IRREGULARITY OF SPEED the best of results were given.

5th. There is no clogging or stopping to clean out the sulphurets and sand; consequently no waste from any inattention on the part of the attendant.

6th. In exhibiting the working of the machine (it is not run empty), all classes of ores and tailings, from 50 pounds and upwards are concentrated that parties may see it to test the machine with.

Give it a trial, and satisfaction is guaranteed. All orders and any information required, address,

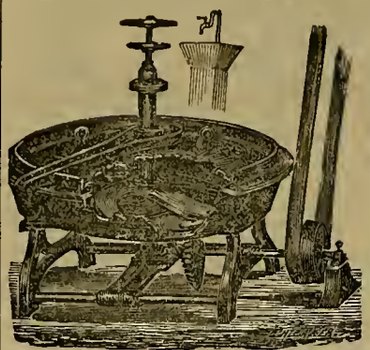
ANDREW HUNTER,

Novelty Iron Works, Fremont st., San Francisco,

15v11-3m Or to E. T. STEEN, Agent.

BAUX & GUIOD S

Separator & Amalgamator



Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine Scientific Knowledge with Practical Experience, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Grniffs Gravel Cement Works, Nevada county; Waltman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Heugh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8–6df

BLAKE'S

QUARTZ BREAKER

Is now extensively used for breaking hard masses of

Quartz or Ores

To a size suitable for stamps. These machines are patented, and are in practical operation in

CALIFORNIA, AUSTRALIA,
WASHOE,
ENGLAND, FRANCE,
—AND—
THE ATLANTIC STATES.

These Machines, or circulars containing further information regarding them, may be obtained of the undersigned.

Address,

BLAKE & TYLER,

Box 2077 San Francisco Post Office.

CHAS. T. BLAKE, Idaho City. E. TYLER, Michigan Bluff. WM. P. BLAKE, San Francisco.

4v10

Hepburn & Peterson's

AMALGAMATOR.

The subscribers would call the attention of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the miner a more expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, Bryant St. bet. 3d and 4th. [Illustrated in the Mining and Scientific Press, April 9th, 864.]

HUNT'S

IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN

HORSE POWER

For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

☞ For further Particulars see small circulars. ☜

Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make,

COMBINING THE MAXIMUM OF EFFICIENCY, Durability, and Economy, with the Minimum of weight and Price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.

Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of milling enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

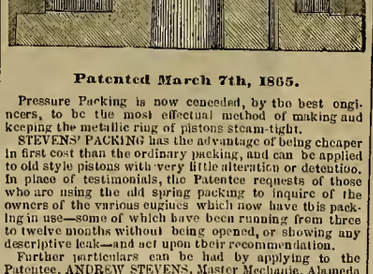
All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Grist Mills.

For sale by **TREADWELL & CO.,**

3v12-3m Corner of Front and Market streets.

Stevens' Pressure Packing.



Patented March 7th, 1865.

Pressure Packing is now conceded, by the best engineers, to be the most effectual method of making and keeping the metallic ring of pistons steam-tight.

STEVENS' PACKING has the advantage of being cheaper in first cost than the ordinary packing, and can be applied to old style pistons with very little alteration or detention. In place of testimonials, the Patentee requests of those who are using the old spring packing to inquire of the owners of the various engines which now have this packing in use—some of which have been running from three to twelve months without being opened, or showing any descriptive leak—and act upon their recommendation.

Further particulars can be had by applying to the Patentee, ANDREW STEVENS, Master Mechanic, Alameda Railroad, or at the VULCAN IRON WORKS, where they can be seen, at any time, in course of construction.

10df **ANDREW STEVENS.**

FOR SALE!

A STEAM ENGINE!

10-INCH CYLINDER, FOUR-FOOT STROKE, IN PERfect Order. Inquire at VULCAN IRON WORKS, 137 and 139 Firststreet, or to

HEYNEMANN & CO.,

26v11tf 311 and 313 California street.

VARNEY'S

PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

Prater's Patent Concentrator

(Known as HUNGERFORD & PRATER'S Concentrator,)

MANUFACTURED AT THE

Important to Miners.

NEW PATENT ROASTING PROCESS.

I am now prepared to offer to the Mining community a New Roasting Process, which has been approved as novel and beneficial by the best authorities in Europe. A furnace can be erected in a few days at a trifling expense, and one man is able to Roast ten tons of Ore or Concentrated Sulphurets per day,

MORE COMPLETELY AND CHEAPER

Than any other Process. All the Sulphur is saved, by being converted into Bisulphide of Carbon, which is a valuable product, and will pay nearly all expenses.

For particulars, apply to

J. MOSHEIMER,

26v11-3m 423 Washington street.

QUARTZ OPERATOR'S

HAND BOOK

A Book for Every Intelligent Prospector, Shareholder, Miner and Machinist.

ZENAS WHEELER AND P. M. RANDALL,

Authors and Publishers.

Bound in Cloth—144 Pages, Duodecimo.

The Quartz Operator's Hand Book is presented to the public as a carefully prepared epitome of all that is valuable for the practical operator in the mine and mill. We have here all the most necessary hints and directions for testing and assaying the ores of the various minerals; an explanation of chemical terms; a brief and intelligible description of the numerous processes for roasting ores, and the extraction of metals from their ores by amalgamation and otherwise.

The work also contains an original and highly interesting discussion of the tractory and differently formed grinding plates, as applied to the reduction of ores—a subject not only of special interest to the scientific reader, but also practically of the highest importance to every quartz miner.

Professor Silliman, of Yale, and Hodgson, of the College of California, having examined this discussion, as submitted to them by its author, Mr. Randall, previous to the compilation of this work, speak of the same as not only mathematically correct, but also as of great practical value. Messrs W. R. Eckart, Jr., Engineer, (late of U. S. N.,) and W. M. Belshaw, assayer and superintendent of the S. T. M. Co., to whom the entire work was submitted while passing through the press, speak of the same as one of high practical importance to quartz miners and millmen generally.

No work has been offered to the mining public of California which contains so much valuable information, condensed into so convenient a space as is here presented. In its preparation, much care has been taken to secure brevity, conciseness, and simplicity—in fact to make it a complete and reliable Quartz Miner's Hand Book.

The Table of Contents of this book will be found on page 415 of the Mining and Scientific Press of July 1st, 1865.

Sold by booksellers generally. Price by mail, postage paid, $1.25. Address "Wheeler & Randall, at the Mining and Scientific Press Office, San Francisco." 2v11

Removal.

The Office of the Mining and Scientific Press has been removed to the old printing stand known as Waters Bros. & Co., southwest corner of Clay and Sansome streets, opposite the Niantic Hotel (being one block south of our former location), where we may now be found, with more commodious apartments and an extensive Job Printing Office.

San Francisco, April 10th, 1865.

Subscribe for it.—The large, illustrated sixty-four column weekly newspaper—the San Francisco Mining and Scientific Press—should be taken by every miner, prospector, and intelligent citizen throughout Colorado, as it gives a mint of most useful information to be gained no other way, on mining matters generally.—[Rocky Mountain News.

RAILROAD TO HUMBOLDT CITY.—A bill has passed the United States Senate, granting aid to a railroad from the Bay of San Francisco to the oil and agricultural regions of Humboldt county. Such a road is greatly needed, must soon be built, and will eventually become most excellent property.

A CHOICE ADVERTISING MEDIUM.

This week we issne an edition of 5,000 copies of tbe YOUTHS' COMPANION, every copy of which will be thoroughly scanned by more than one pnir of sharp little eyes, and the contents of every page, from first to last, will be re-uttered by many active, lively tongues in tbe presence of over 4,000 of tbe best families in tbis city and State.

Although we are receiving many ndditional snbscribers to our list in response to the new enterprise in which we have engnged, we cannot expect, with tbe present bigh cost of printing paper, and our very low terms, to receive sufficient money from subscriptions alone to furnish as good a journal ns we hnve determined to publish for our patrons; so we have widened tbe columns of the paper nnd adopted smallcr type, wbich admits more letters in each line, nnd mnny more lines in encb column of the paper, tbat we may bave room for a few more select advertisements in the COMPANION *without decreasing in the least* any class of reading matter.

Our little journal circulates in more families than nny other weekly published in San Francisco. No advertisements of tbe least objectionable character will be received, and as but n limited space will be devoted to this dcpartment, our young friends can safely inform tbeir storekeepers, and other business acquaintances of these important facts for tbe benefit of the paper and all concerned.

Remember, only a few columns of our regnlnr issue will be devoted to advertising, and the more profitable that clnss of patronage is made the greater will be the onthy upon our reading columns.

DEWEY & Co., Publishers.

February 23d, 1866.

BY MAIL.—The MINING AND SCIENTIFIC PRESS will he sent by mail to any part of the civilized world. In case of removal, subscribers bave only to inform us of the post-office address of their old and new location, and the paper will be sent accordingly.

SNND US WOAD.—If any subscriber to this journal fails to receive the same regularly and promptly, they will confer a favor by informing us at once.

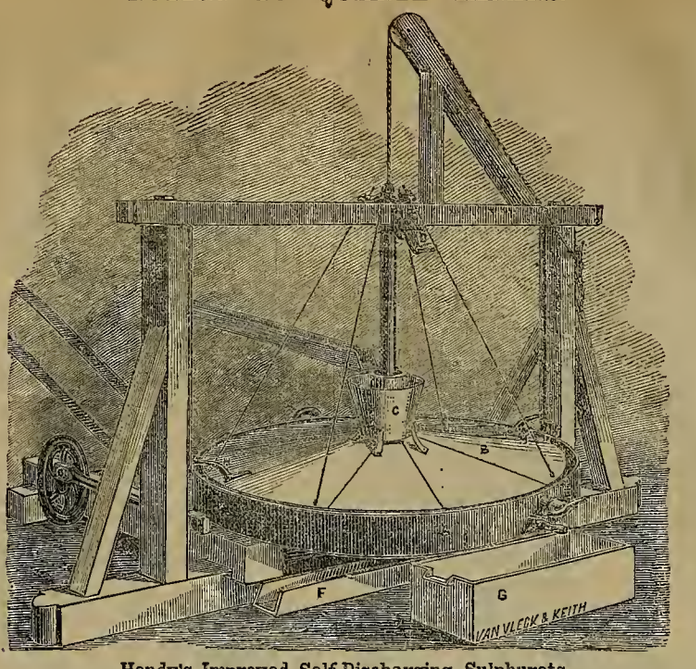
NOTICE TO QUARTZ MINERS.



Hendy's Improved Self-Discharging Sulphurets

PRATER CONCENTRATOR

Is Receiving Universal Favor.

Reference is made to the following Mills which are using the Prater Concentrator, with some of the improvements attached. The Self-Discharging Sulphurets has been more recently adapted, and the public attention is called to examine its workings:

STEPHENS' MILL, Humboldt County, Nevada.
CHRYSOPOLIS MILL, " " "
U. S. REESE RIVER MILL, Austin, "
CARROL & ASPINWALL MILL, Reese River, Nevada.
UNION MILL, El Dorado County, near Mud Springs.
NEW YORK AND EL DORADO CO., "
BLUE LEDGE MILL, near Spanish Flat, El Dorado Co.
CONEY MILL, Jackson, Amador County.
Messrs. TUBBS & CO'S MILL, San Andreas, Amador Co.
WINTER'S MILL, Angels Camp, Calaveras County.
CLIO MILL, Jacksonville, Tuolumne County.

And in use in other parts of this State; also in Idaho, Arizona, Colorado and Mexico.

As a further evidence of its worth, orders have been received recently from the proprietors of the following mills, all of whom are using these Concentrators, or have works in the immediate neighborhood of mills using them, viz.:

One Concentrator ordered for the Coney Mill, Jackson, Amador County, by Messrs. Bigelow & Bro., of this city.
Three Concentrators for the Spring Hill Mill, Volcano, Amador County.
Two Concentrators for the Golden Gate Mill, Volcano, Amador County.
Four Concentrators for the Raw Hide Ranch Mill, Sonora, Tuolumne County.

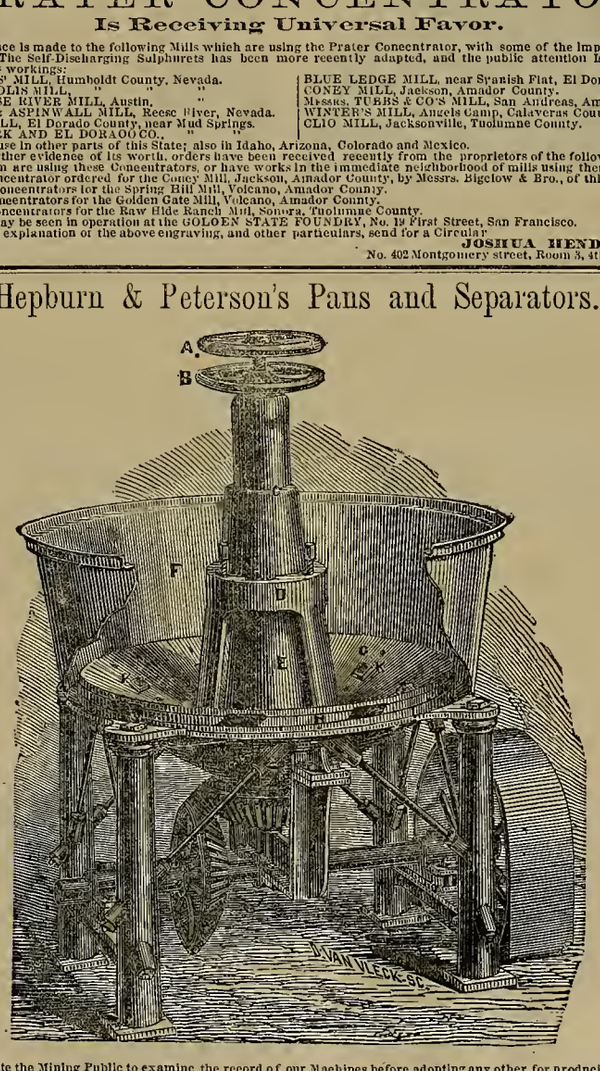
They may be seen in operation at the GOLDEN STATE FOUNDRY, No. 19 First Street, San Francisco.

☞ For explanation of the above engraving, and other particulars, send for a Circular.

JOSHUA HENDY,

8v12tf No. 402 Montgomery street, Room 3, 4th floor.

Hepburn & Peterson's Pans and Separators.



WE invite the Mining Public to examine the record of our Machines before adopting any other for producing similar results. They have been in general use for the past three years, during which time they have been repeatedly tried in comparison with every other machine of note, and of a similar nature, and have invariably been adopted in preference; which facts we offer as the most suitable recommendation, and which is attested by the following list of

Principal Mills Using them:

Rivers of Oil.—Edward Everett, in his last public speech, in referring to the prolific resources of the United States, remarked that "the very clods of earth are pouring out rivers of oil." This remark, at the time, was considered nothing more than a very appropriate rhetorical flourish; but late accounts from the oil regions of Western Pennsylvania appear to attach an almost literal signification to it. A New York paper, of a late date, says:—

"Last week it was discovered, near Pithole City, that the oil at various places was oozing from the surface of the ground, wells of water seeming suddenly to be changed to petroleum fountains, and men, women and children rushed with every available vessel to scoop up the fluid from holes only a few feet deep."

Whether the oil which thus appeared was the result of surface drainage from the wells, or some new development of the earth's crust, or whether it was a new and accidental discovery, we are not informed. Neither are we informed as to whether this phenomenon has proved or is likely to prove continuous; but, at all events, it is eminently illustrative of the new fountains of wealth which are constantly being opened, in every direction, by the scientific researches of our learned men, or the busy hands of our enterprising pioneers. With the inexhaustible treasures of our gold, silver, copper, iron, coal, etc., the wonderful development of our earth oils, and the teeming products of our fruit and agricultural lands, all added to the mechanical skill and enterprise of our mechanics and manufacturers, who can tell to what hights of wealth, power, and greatness the American people may not attain?

A Wood Splitting Machine.—The San Francisco Fuel Company are now employing a wood splitting machine at their works on Long Bridge, in this city. The machine is the invention of Capt. Taylor, a working member of the company. It consists of a heavy iron bed-plate, from the centre of which rise four iron wedges, in the form of a cross, thus: + The blocks of wood, previously sawed into short lengths by a circular saw, are successively placed on the top of this wedge, when a heavy weight, like a pile-driver hammer, is slowly brought down on the top of the block, forcing it down over the wedge, until the stick is divided into four pieces. The operation is repeated with each separate block, until the wood is reduced to the requisite size. The weight is easily governed in its motions by a crank, so as to be driven back on the instant the wood gives way under the pressure. The machine does the work much cheaper than it can possibly be done by hand; even the toughest and most knotty sticks yielding easily to the heavy pressure that can be brought to bear upon it.

HOME INFLUENCES.

How strong, how sweet, how sacred are the ties that bind together loving sisters and brothers. How balmy the influence of that affection, which dwells around the fireside of a family of loving children, and children beloved. It is like a mild atmosphere in a bright spring morning; it enters into a child's soul like the sunshine into a rosebud, slowly but surely expanding it into loving beauty and vigor. Distrust and doubt are strangers in such a family; self-interest and jealousy mar not the happiness of such a household. The heartless forms of *fashion* give place to manners sweet, gentle and courteous, presenting a union of hearts, undivided in study, in spirit and in interest. Parental kindness and filial affection flourish there, and bloom in all the freshness of eternal spring!

A man who has grown up among kind and affectionate sisters, and loving parents, carries their influence through all his after life, even to old age. He ever gives evidence of a rich development of those tender feelings of the human heart, which can spring from no other source. It matters not if he goes out upon a heartless or a frowning world, or if now and then his heart grows cold from chilling contact therewith; he will at times warm and thrill with the mere memory of the happy scenes of his earlier years, as an occasional incident awakens in his mind the memory of the soft voices and kindly influence of the loving circle in which he received his earliest and holiest impressions.

If he is sorely tempted, such recollections will serve to turn him from any purpose of wrong, which an improper influence or a false philosophy may seek to urge upon him under the guise of expediency. The memory of a sister's kindness, the gentle influence of a mother's teaching, serve in all after time, as a balm to every ill, and a monitor against every meditated evil—they are like beacon lights, ever beaming, ever shining, to guide us along the pathway of life!

Perpetual Motion.—Mr. John M. Peterson, of this city, has invented a machine which he claims will move without any extraneous assistance. It is composed of weights and balances, ingeniously conected with endless chains, following over geared cog-wheels and pulleys. The invention is a difficult one to describe without a diagram. Although no convert to the theory of perpetual motion, on a practical scale, we nevertheless give Mr. Peterson the credit of a very ingenious contrivance in that direction.

A New Water Engine.—A very neat and ingenious piece of mechanism, closely resembling a steam engine, but designed to be driven by water, under a high pressure, may be seen at work in the window of C. J. Hawley & Co's store, on the corner of Stephenson and Second streets, in this city. It was manufactured at the Union Foundry, and is the invention of a gentleman engaged as an architect in this city. It is an ingenious and useful piece of machinery. Application for patent has been made through the Mining and Scientific Press Patent Agency, by Mr. Marquis, inventor of its peculiar improvements.

Petroleum Stoves—We would call attention to Messrs. Bullard & Battles' advertisement of the "Petroleum Stoves," which will be found in another column. These stoves have now been tested in this community, and we understand that they have satisfactorily established their claim to consideration as a convenient, economical, and labor-saving invention for all manner of cooking, and for ironing. By them, in baking, whether of bread, pastry, or meats, there is small chance, *no* need of, failure—as the heat is in perfect control of the operator, and at all times directed to the very point where needed. In ironing, the inconvenience of a surplus heat, and the waste of time in feeding the fire and heating the irons, are avoided; and an ironer can do about twice as much work in a given time as by the ordinary method of heating the irons. In broiling, they are far superior to other stoves. The meat being exposed in its entire surface to a strong and equal heat from the instant it is put on, is speedily cooked through without burning the outside, or the loss of the juice, which gives delicacy of flavor and liveliness of taste to a steak. No ashes, smoke, or soot result from the use of these stoves. The fire is easily lighted, and when once going, needs no care except that to regulate it to the degree of heat necessary to the work in hand. As no pipe is required, the stoves can be used in any room or part of a room, or out-doors, if sheltered from the wind. To see the stoves in operation, as one can any day, at 316 Montgomery street, is enough to satisfy the most skeptical, even, of their convenience and excellent adaptation to the circumstances of thousands in this city.

"Usm."—This new word was recently coined on our beautiful bay, under the following circumstances: A young gent and miss on the Oakland ferryboat were engaged in affectionate conversation, when their attention was attracted by a large steamship lying in the stream. "What is the name of that noble ship?" inquired the lady. "The 'Usm,'" responded the knowing youth, with significant promptness. "The 'Usm,'" why, I never heard such a name." "Yes," he continued, "the 'Usm;' can't you read those large letters on the side, U. S. M.—'Usm,'" (United States Mail). Young miss saw the drift, modestly turned aside into gentle convulsions, and was soon after engaged in walking the young gentleman about the deck for the benefit of his health, and a more secluded portion of the boat.

A new and curious application of electricity has recently been made by an ingenious Frenchman, who arranges a long wire, connected with a galvanic battery, sustained upon glass supports, along any place frequented by rats. Upon this wire are strung, at intervals, pieces of fresh meat, which the rats are prompt to nibble at, and which they no sooner get hold of than they bring down an electrick shock, sufficiently powerful to produce instant death to the *rodents*.

The presence of silver in the copper sheathing of ships, after long continued voyages, has been proved, even to the extent of seven ounces to the ton.

Explanation.—"Our Regular Corrsspondent," whose letter we publish to-day, in his notice of the "Mina Rica de Las Flores Mining Co.," asks for an explanation of a phenomenon, noticed in that mine, where both walls of the mine are in granite for 100 feet beneath the surface; but below which point the hanging wall is of talcose slate, while the foot-wall continues granite all the way down. The phenomenon is easily explained by supposing—which is very probable—that the slate is metamorphic and irruptive, and that it was forced upwards in the form of a dyke; but not quite to the surface. This action would naturally have formed a fissure, probably of contraction, which might have reached the surface, rendering the quartz which was subsequently infiltrated or irrupted *a true fissure vein*, and a most certain evidence of a continuous and valuable one. Or the granite itself may be irruptive, having been forced up through the slate quite to the surface, and covering it deeper at one point than at another. Either case is a supposable one; and the probability of the one or the other is to be determined only by personal and scientific examination.

Improvement in the Chronometer Escapement.—Mr. Wm. H. Lamb, an ingenious watchmaker of this city, has recently perfected an important improvement in the chronometer escapement, for which he has taken the preliminary steps to secure a patent. The object of this improvement is to make a chronometer escapement more fully applicable to an ordinary pocket time-piece than anything heretofore devised. It is well known that the chronometer now employed is not safe, from its liability to stop, or otherwise get out of order, from sudden jars, such as those encountered in jumping, riding on horseback, etc. The same objection also obtains with regard to the duplex escapement. Mr. Lamb's improvement consists in the attachment of a double, or right and left, impulse to the balance; making the watch, so constructed, as valuable and safe a time-piece as the lever, and at the same time preserving all the beauty and freeness of movement to the balance which the chronometer now in use possesses.

Mechanics' Institute.—At a meeting of the Board of Directors of the Mechanics' Institute, held last evening, Wm. Bausman, Esq., was elected Librarian, and J. B. Pierce, Assistant Librarian. The Institute has purchased the lot on Post Street, and it is expected that a new building will soon be commenced.

To Correspondents.—Answer to "A Miner," of Stockton, next week; "Mining at Mount Diablo" will appear. The queries of our Mount Diablo correspondent will be answered at our earliest convenience.

Shasta Courier.—This sterling mountain journal has entered upon its fifteenth volume. We wish it continued success and prosperity. We find its columns of great value for local intelligence.

Mining Dividend.—The Crown Point Gold and Silver Mining Company have declared a dividend of $50 per foot.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

THE TRACTORY CURVE, AND THE PROPERTIES OF GRINDING PLATES.

BY W. A. GOODYEAR.

[CONTINUED FROM PAGE 146.]

It is easy, however, to show analytically that in the branch of the secondary curve which lies upon the concave side of the original tractory, there are always values of y' that are greater than a, that is, that the *hook, above* the line $y = a$, is always formed, whatever be the value of b, (provided b he not absolutely 0, in which case there is no secondary curve,) and, therefore, that this curve is never a tractory, since in the latter no value of y can he greater than a.

To show this, let us find the point where the normal to the tractory, at the point x, y, crosses the line $y = a$. Represent the coordinates of this point by x'', y''. Now, since the point x'', y'', is in the normal to the tractory at the point x, y, its coördinates must satisfy equation (51). Therefore, we have

(56) $y'' - y = -\frac{dx}{dy}(x'' - x)$. Since the point x'', y'', is also in the line $y = a$, its coördinates must satisfy this equation also. Hence,

(57) $y'' = a$. If, now, we substitute the kuown value of $\frac{dx}{dy}$ in (56), and then obtain from (56) and (57) the value of x'' in terms of x and y, we have

(58) $x'' = x \mp y\sqrt{\frac{a-y}{a+y}}$. Now, since in (58) x and y still represent the coördinates of points in the tractory, we know that hy taking y as near a as we please, we can make x as near 0 as we please. Therefore, (58) shows that hy taking y as near a as we please, we can make x'' as near 0 as we please. In other words, that by taking points in the tractory as near the point $y = a$, $x = 0$, as we please, we can make the normal at the poiut x, y, *cross* the line $y = a$, *as near the point* $y = a$, $x = 0$, *as we please.* Therefore, however small b may be (provided it he not absolutely 0), there are still points in the tractory so near the point $y = a$, $x = 0$, that their normals cross the line $y = a$, at a less distance than ba from the point $y = a$, $x = 0$. Therc are, therefore, always points in the secondary curve whose ahscissas are less than ba, and whose ordinates are greater than a, and which, therefore, lie ahove the line $y = a$. The *hook* referred to is, therefore, always formed, however small b may be. That the hook is always formed when b is large, is sufficiently evident.

The secondary curve, then, is never a tractory; and this heing the case, the distances in a direction parallel with the axis of x, from the original tractory to the secondary curve, are *not* constant.

The demonstration given upon page 103 of the Hand Book is faulty, inasmuch as in the figure there used, the lines o c and o' c', which are made to represent the wear perpendicular to the tangent, and are proportional to tbe ordinate, are not drawn perpendicular to the tangent *at the point of contact*, where this wear would actually take place, if it could take place at all, hut at a distance from it, so that the figure does not answer to the conditions of the prohlem there handled.

I may remark here, that although we cannot conveniently ohtain the equation itself of the secondary curve ahove discussed, we can yet, without difficulty, ohtain the differential coefficient of y' with respect to x' in terms of y, and hy means of this, demonstrate one or two other points in relation to the curve. The value of this differential coefficient is the following:

(59) $$\frac{dy'}{dx'} = \frac{y}{\sqrt{a^2 - y^2}} \times \frac{2by^2 - a^2 b + a\sqrt{a^2 - y^2}}{2by^2 + a\sqrt{a^2 - y^2}}.$$

From (59) we see that if we make $y = a$, then $\frac{dy'}{dx'} = \infty$. But from the conditions under which the curve is formed, we know that when $y = a$, y' also $= a$, and $x' = ba$. Therefore, at the initial point $y' = a$, $x' = ba$, of the secondary curve, its tangent is perpendicular to the axis of ahscissas, and the curve itself is tangent to the tractory which hegins at the same point.

Again, if we make $\frac{dy'}{dx'} = 0$, we shall ohtain the point or points where the tangent of the secondary curve is parallel to the axis of ahscissas. But the equation $\frac{dy'}{dx'} = 0$ can can he satisfied in two ways, viz., hy making $y = 0$, or hy making

(60) $2by^2 - a^2 b + a\sqrt{a^2 - y^2} = 0$.

Now, we know that when $y = 0$, then y' also $= 0$, and x and x' are hoth infinite. Therefore the axis of ahscissas is also an asymptote to the secondary curve.

Equation (60) gives

(61) $$y = \pm\frac{a}{2b}\sqrt{\frac{1}{2}(4b^2 - 1 \pm \sqrt{8b^2 + 1})}.$$

Therefore, at the point in the secondary curve, corresponding to the point in the tractory, where

$$y = \pm\frac{a}{2b}\sqrt{\frac{1}{2}(4b^2 - 1 \pm \sqrt{8b^2 + 1})},$$

the tangent of the secondary curve is also parallel to the axis of ahscissas. It is very evident that this curve is not a tractory.

Let us now consider some of the conditions of grinding.

If two grinding plates, of tractory conoidal or any other form, rest uniformly the one upon the other without motion, the pressure hetween the two, in direction as well as in amount, is determined solely hy the *weight* of the upper plate, and if the latter he of uniform thickness in a vertical direction, the pressure *in a vertical direction* is uniform, or constant.

If the plates he curved (whether they he of tractory conoidal or any other curvilinear form), the vertical pressure at any point may he resolved into two components, one of which is parallel and the other perpendicular to the tangent of the meridian curve at the same point.

The component parallel to the tangent is taken up hy the hody of the plates themselves, and hecomes null in effect. The other component remains; and it is easy to show that in tractory conoidal plates, if the upper plate he of uniform vertical thickness, this last component varies as y, and, in fact, is equal at any point to $R\frac{y}{a}$, if R denote the constant *vertical* pressure. These conditions hold so long as the plates remain motionless. If the upper plate hegins to revolve, the conditions of pressure are then *changed*, and in a manner depending upon the form and relative hardness of the different portions of the plates.

[To be Continued.]

An old man and a little child stand upon the threshold of time, the two looking different ways.

[Written for the Mining and Scientific Press.]

From Our Regular Correspondent.

Editors Press: After a trip in the northeastern part of the county, I find myself enjoying the kindly hospitality of Mr. Bever of the Rich Gulch Hotel, and having spent most of this time in a highly interesting, but rather unappreciated section of country, I am led to believe that some account of my "wanderings and short comiugs" therein may be of interest to the public.

Leaving Mokelumne Hill on the afternoon of the 16th instant, I reached the residence of Colonel Rust, three miles above which place, about sunset, and accepted his kind invitation to spend the night. The Colonel is one of the pioneer newspaper men of the coast, having been at one time editor of the Marysville *Express*, and having heen at different times connected with many enterprises of the kind in our mountain towns. He is fond of relating his experiences in those early days of newspaper work, and I was equally fond of listening; so between us two, the evening passed quite pleasantly away. The next morning I started quite early for West Point, where I arrived about one o'clock, having met on the way many of those whose acquaintance I had made last spring, in all of whom I found friends and helpers. The most of my time was spent in West Point and Sandy Gulch districts, which lie between the north and south forks of the Mokelumne river, and are separated by the middle fork.

WEST POINT DISTRICT

Lies on the north side of the middle fork of the Mokelumne, and is at present the most prosperous and enterprising quartz-mining district in the county. It is well supplied with wood and water, both being abundant and cheap, thus offering every facility for working, at small cost, the rich auriferous ores which the numerous ledges so abundantly yield. The veins of this district are situated in a granite formation, and are quite irregular in width above the water line; at which point they were heretofore supposed to disappear, none having been worked below that line until within a year or two. They are also frequently cut hy dykes or "elvans" of granite, trap or slate, which gave rise to the helief that they were generally of insignificant extent, longitudinally. The explorations on the Mina Rica and Sacoterre, and the Cummings and Hadley veins in this district. and the Belding in Amador county, which is also on the same range and in the same formation, have proved almost heyond doubt that the veins in this district are as permanent, though not so extensive, as any in the State. The width of the veins vary from two to three inches to as many feet, and the yield of the ore is from 20 to $200 per ton; quartz paying less than twenty dollars not being considered rich enough for profitable working. Owing to the belief that the ledges, or "bunches," as they are here called, were not extensive, but few mills have been built for the working of any particular leads; but most of the quartz is crushed at custom mills, whose charges vary from five to seven dollars per ton; the latter price being charged for working in an arastra; that process being quite popular with some classes of the population. The principal custom mills now at work in this district are Henry's of five stamps, on the Middle Fork, one mile south of town; Schmidts, of five woodeu stamps and two arastras, on the same stream, some 400 yards above Hendy's; the Belcher mill, of eight stamps and two arastras, abont a mile above Schmidts, and the Skull Flat mill, at Skull Flat, two miles northeast of town, of eight stamps, all of which were more fully described iu my letter from this place in April last.

Besides these may he mentioned Carlton's mill, situated one and a half miles below West Point on the Middle Fork, consisting of three wooden-stem stamps and two arastras, driven hy water power, with an overshot wheel. This is one of the most substantially huilt mills of the kind that I have ever seen. It is capable of working two and a half tons of ordinary quartz daily, the rock being first broken by the stamps into pieces of the size of filberts, after which it is ground and amalgamated in the arastras. The old Nestor mill, now owned by Mr. Lidstrom, of Masun's brewery, San Francisco, and run by Mr. Fred Morris, formerly in charge of the Mina Rica mine and mill, consists of three stamps and two arastras, driven like the last hy water power; but is in a very dilapidated condition, as is also Bryant's mill of two stamps and one arastra, situated near. The owners of the latter, however, inform me that they intend improving their mill soon. Both these mills are located on a small stream called Bear creek, about a mile east of town. The principal mill of the district, is that of the

MINA RICA DE LAS FLORES MINING COMPANY,

Located at Camp Flores, one and a half miles east of West Point. This mill consists of ten heavy stamps driven by a steam engine of thirty horse power, and is well and substantially huilt. Amalgamation is performed in small pans into which the pulp runs directly from the hatteries. The tailings are again ground, and amalgamated in one of Baux & Guind's amalgamators, by which means the yield of the quartz is increased from twelve to fifteen dollars per ton. The average yield of the rock is from thirty to thirty five dollars; at least this is the estimate of the superintendent. This company own two veins, the Mina Rica and the Lockwood. On the former a shaft has heen sunk to a depth of 130 feet, showing a well defined vein of quartz from fourteen inches to two feet in width, and much of it heavily charged with sulphurets. At a depth of 112 feet, drifts have heen run lengthwise of the vein a distance of eighty feet, disclosing a large vein of rich ore. The course of this vein, like that of all others in this range is nearly north and south, with a very slight dip to the westward. As I have before stated, the surface of this district is all of granite formation, hut on reaching a depth of 100 feet, the hanging wall of this vein is of talcose slate. while the foot-wall remains granite all the way down. This is the only instance of the kind which has come under my observation, and I should like to see some explanation of the case hy geologists. The Lockwood has been explored to a depth of 100 feet, and by drifts along the vein a distance of fifty-nine feet. It is from eighteen inches to three feet thick and yields quartz of a character very similar to the Mina Rica. The rock is hoisted from both of these mines by horse power, the mining being done by Cornishmen, on contract, at fixed prices per foot, for sinking or driftiug.

The richest lode yet discovered in the district, is believed to he

THE CUMMINOS & HADLEY,

Owned by the parties whose name it bears, and who are making a vigorous effort to test its permanence and valuc, and with very fair prospects of success in developing a valuable mine. This vein is crossed hy two dykes of hard slate about ten feet apart, between which the shaft has been sunk to a depth of ninety feet. No attempt has been made to drift through that on the north side, and its thickness is not known, but the ore on the south side of the shaft, has been found to be about three feet wide at the top, and to narrow gradually as it goes down, until at the depth of ninety feet it almost disappears, and the two portions of the vein are almost united. The vein at the hottom is about four feet in width, while its average thickness is fully twenty inches. I visited the mine on Saturday afternoon, the 17th instant, in company with Mr. Robert Briggs of West Point. We were informed that the rock from this vein, worked at Carlton's mill, which is ahout half a mile distant, had averaged from $140 to $150 per ton. A short distance south of this is the Amo lead, owned by Messrs. Carlton and Fischer, which has been opened to a depth of 100 feet. It dips to the west, at an angle of thirty-three degrees, and is about one foot in average width. The quartz differs from most of that in the district in containing no sulphurets. It has yielded about $85 per ton in free gold.

On Monday morning I started to visit the mines in the neighborhood of Skull Flat, and on the way, fell in with Mr. A. M. Harris, of Sandy Gulch, who was visiting Skull Flat on business.

The oldest and most productive mine in this vicinity is

LA SACOTERRE,

Situated about half a mile southwest of the Skull Flat mill, and owned hy the Cassner Bros., who are also owners of that mill. The lead was first discovered in 1855, since which time over $100,000 are said to have been taken out. It has been opened by a shaft to a depth of 120 feet, while on the level of the bottom of this shaft a tunnel has been driven into the hill a distance of 300 feet, eighty feet of which is on the vein. Its usual width is from fifteen inches to two feet, though I was told that at the bottom of the deepest shaft, its width was three feet. The average yield of the rock worked from this vein for the past eleven years is set down at $80 per ton.

On what is supposed to be an extension of this lead, Messrs. Wilson and Keys have struck some very rich rock, some specimens of which were presented to me by Mr. Wilson, which show a large amount of free gold. They found the vein divided into two parts each about five inches wide. They have sunk to a depth of about forty feet, and opened the ledge for a distance of fifty feet north and south. It is believed that the rock taken out will yield at least $100 per ton.

Another very valuable lead is that of Messrs Barnes & Cassner, mentioned in the letter mentioned above, as written last April. The lower tunnel has been completed, and has struck the ledge after running 275 feet, at a depth of 160 feet. Drifts have been run on this level a distance of ninety feet, disclosing a vein from four inches to three feet thick, averaging about twenty inches. No rock had been crushed since my last visit, but that lying at the mouth of the tunnel, was pronounced by the millmen in the party to be very rich. The rock worked last year paid over $100 per ton.

About a thousand feet west of the above is the ledge claimed by Messrs. Hildebrand and Fields, which is from four to twelve inches in thickness, and has paid $45 to $70 per ton. It is opened to a depth of 120 feet below the surface by a tunnel 150 feet in length along the lead, and a shaft has been sunk, thirty feet below the tunnel. This lead shows no signs of "giving out."

Half a mile northeast of Skull Flat, is the Texas lead, owned by Mr. J. Candrum, familiarly known among the miners as "Texas," by whom it was discovered and opened in September last. He has opened it along the surface for a distance of some twenty or thirty feet. Its average breadth is about ten inches, and the rock has paid about $35 per ton. Near the Texas, Messrs. Johnson and Willis have discovered and partially prospected a lode about a foot wide, which they think will pay $70 or $80 per ton, though none of their quartz has yet been crushed. On my way back to West Point I visited the mine of Gouldson & Co., situated one and a half miles east of West Point. They have opened their ledge but about fifteen feet down from the surface, as they are troubled with water. It has been thus far about two feet in average width, and the rock taken out for a distance of fifty or sixty feet along the surface has paid, according to the statement of Mr. Gouldson, $120 per ton. The owners are now engaged in running a tunnel from the ravine to the westward of the claim to strike the lead. This is in now a distance of 275 feet, and lacks about seventy feet of having reached the ledge. The tunnel is ventilated by air-shafts bored upward through the granite to the surface, with a two-inch auger. I have not noticed all the ledges discovered, nor all of which I have notes, but only enough to give the reader something of an idea of the character of the quartz mining operations now carried on in the West Point district.

On Tuesday morning, I left West Point in company with the Superintendent, Mr. J. K. Pine, to visit the works of

THE EAGLE QUARTZ MINING COMPANY,

situated on the right bank of the north fork of the Mokelumne, in Amador county, and about two and a half miles north of West Point. The property of the company consists of five different ledges, on each of which they claim 4,000 feet. The principal of these are the Contreras, and the Eagle. The former of these is believed to be the most valuable, as it proved to be very rich when worked by Mexicans some years since. Mr. Pine commenced work for reopening it during my stay, and with flattering prospects: The work of the company has heretofore been confined to the Eagle ledge, as that was most favorably located for convenience in removing the quartz to the mill, which was built before the property came into the hands of the present company. This ledge, like the Contreras, was originally worked by Mexicans, and was said to be very rich on the surface. Mr. Pine has run a tunnel into the hill a distance of 160 feet, half of which distance it is on the ledge. Where the ledge is first struck, at a distance of eighty feet from the mouth of the tunnel, it is about eight inches thick, but on following it thirty feet further, a body of quartz, two feet wide was struck, and in twenty feet more, one of three feet, while at the back end of the tunnel there is scarcely any quartz at all, the distance between the walls, about three feet, being filled with different strata of slate, greenstone talc, etc., all, however, containing more or less gold, and Mr. P. is sanguine that the quartz will again fill the vein at a distance of a few feet farther in. Meantime Mr. Pine is taking out from stopes above and below the tunnel sufficient rock to keep the mill running. The rock crushed thus far has paid an average of $35 per ton. The mill consists of one 5-stamp battery and a Baux & Guiod's pan. The latter is of a new pattern, which Mr. Baux calls improved, but it does not seem to work as well as one of the first style, now in use at the Mina Rica. Still, however, it gives pretty good satisfaction. The mill is driven by water power, furnished by a large overshot wheel, driven by water taken from the river about half a mile above. The upper part of the flume carrying this water was submerged during the freshet last winter to a depth, I am told, of fifty feet, yet it was never moved. It is a light inclosed flume, with no timber heavier than the inch boards of which it is built, and is fastened down to the living granite by half-inch rods of iron bent over the flume and wedged in at each end, into holes drilled in the rock. The whole work was designed and executed by Mr. Pine, for the Eagle Co., and is a triumph of engineering skill, over natural obstacles of the most stubborn character. During the afternoon, Mr. Pine, Mr. Walker, and myself visited the Pioneer mine some three miles to the northeast of the Eagle, and three and a half above Volcano. This mine I have noticed more at length in a former letter. The object of our present visit was to see the working of the concentrating and amalgamating machinery, invented by the Superintendent, Mr. Ambler, and which we understood had been started the day before. We found Mr. A. busy putting up the machinery, which was started only a few minutes before we were compelled by the lateness of the hour to return, and I was unable to get as full an idea of the machinery as I should be glad to do before attempting a description of the process. The concentrating apparatus consists of a "slum-tub" or settler, and a concentrator, the former being made of iron, and on exactly the same principle as "Stevenot's Concentrator" described in a letter from Robinson's Ferry, published in the PRESS of March 25th, 1865, with the exception that this is made of iron and that was of wood. The concentrator consists of a trough with sides of wood with bottom and vertically curved ends of galvanized iron, so hung that one side shall be about one-eighth of an inch lower than the other. Over the lowest side is placed a fine screen, to secure uniformity in the size of the particles passing into the concentrator, which is given, by means of an eccentric or crank, a jarring, longitudinal motion, which causes the lighter portion of the sands to be carried off by the stream of water running out at the higher side of the concentrator, while the sulphurets and heavy matter, settles on the lowest side. The amalgamator is attached to the same beam, and shares the motion of the concentrator, and is of the same form, differing in having the bottom formed of amalgamated copper-plate, instead of iron, and being set perfectly horizontal instead of slightly inclined. Across the top of the amalgamator is secured a wide board, in which are fastened a large number of little wooden pegs, which reach to the bottom and break up the pulp, as it is thrown against them by the jarring of the machine, causing the quicksilver to be more thoroughly mixed with it and preventing it from packing on the bottom of the trough. I am not sufficiently posted to be able to say whether this machinery will succeed or not, but my companions, both practical men, expressed themselves as highly pleased with its operation. One thing is certain; it is cheap, and requires very little power, which is quite a point in its favor.

After spending the night at the Eagle, Mr. Pine very kindly loaned me his horse to visit

THE BELDING MINE,

Located a mile and a half above the Eagle, on the same side of the river, but distant, by the road, about five miles. This mine is owned by the California Furnace Co., of San Francisco, and superintended by Mr. J. C. Benjamin of Volcano. A shaft has been sunk on the ledge to a depth of 154 feet, all the way through hard granite. The ledge is of an average width of two feet as far as explored, and evidently improves as it goes down. It is the most regular in its size and character of any ledge in this range. The shaft is three feet by six in the clear, and well and thoroughly timbered with heavy sawed timbers, making a fine working shaft for a permanent mine.

The mill consists of five stamps, with one of Wheeler & Randal's (No. 1) pans, used as a grinder and five of Knox's amalgamators. It is driven at this season of the year by water power; but a 10-horse steam engine is used in dry weather. This company have constructed a furnace for roasting and desulpharizing ores by O'Donnel's superheated steam process. The furnace has a capacity of fifty tons. Mr. Benjamin estimates that by this process, the yield of gold is increased from one-third to one-half, with a very slight increase of cost. Mr. B. says that for four years, the mill has never been stopped for want of quartz, and that the average pay has been $85 per ton. I dined with Mr. Benjamin, and remounting soon found myself at the Eagle mill, where I spent the night, and on the morning of Thursday bade good bye to my obliging host, and started in company with Mr. Anderson, one of the employees of the Eagle Co., for West Point, on our way to visit a ledge claimed by Messrs. Anderson & Smith, and situated on Anderson's Flat, four miles above. On our way up, we called at the Mina Rica, and on our return stopped and took dinner with Mr. Morris of the Nestor mill, who showed us a lead, which he had located and was working, or rather prospecting with fair promise of success. The ledge is about two feet wide, and is opened on the surface for a long distance, though I believe at no point to a greater depth than about twenty feet. He has about 300 tons of quartz out which he estimates at ten dollars per ton, which would give very little profit in working by the "arastra" process, but Mr. M. hopes to make it profitable, when cheaper and more effective means of crushing are introduced.

D.

Rich Gulch, Calaveras co., Feb., 1866.

[To be Continued.]

[Written for the Mining and Scientific Press.]

Resources of Siskiyou County.

BY PROF. O. K. GODFREY.

Agreeably to promise, I now send you a sketch of the agricultural and mineral resources of Siskiyou county.

This large county stretches nearly across the northern extremity of the State, and is worthy of notice not only in a mineral point of view, but also on account of its rich agricultural lands. It is interspersed with and surrounded on all sides by towering mountains, one of which is Mount Shasta, the highest peak in California. [The examinations of Professor Brewer, of the California State Geological Survey, made in the summer of 1864, near the head waters of the Kern and Kings rivers, in the southern portion of the State, prove that there is at least one peak in that vicinity which overtops Mount Shasta, and is in all probability the highest mountain in the United States. Mr. Brewer ascended this peak to the hight of 14,750 feet, at which point his progress was stopped, although he had not reached the top. A brief account of this reconnoisance was published in this paper under date of October 8, 1864.—EDS. MINING AND SCIENTIFIC PRESS.] There are three fine valleys—one at the extreme eastern part of the county and two in the western.

Surprise, Shasta and Scott valleys redeem it from the sterility and ruggedness of its general aspect. These valleys, though elevated several thousand feet above sea level, are very fertile, and susceptible of a high scale of cultivation. Rich green foliage, which clothes them in spring and early summer, presents a singular contrast with the snowy-clad peaks around them.

Surprise Valley is situated fifteen miles to the southeast from Goose Lake, on the eastern slope of the Sierra Nevada mountains. It lies north and south, and is fifty miles in length from actual measurement, and averages about ten miles in width.

Lassen's old emigrant road passed through the upper end of this valley between two lakes, and but little was known about it till the boundary survey was made between Nevada and California. The line runs lengthwise through the eastern portion of the valley.

The most prominent and attractive features of the valley surroundings are the three lakes located in different parts of the valley, and the Sierra Nevada pine-clad mountains, having a number of creeks gushing forth from their summits, and winding through the valley, which finally empty into these lakes. During the past two years it has proven to be susceptible of growing all kinds of grains and vegetables.

Shasta Valley presents rather a singular appearance from its formation. It is about thirty-five miles long and some ten miles in width, and stretches away from the base of Mount Shasta to the northwest, where the lower end narrows to a cañon, through which Shasta river runs and empties into the Klamath. This valley is studded with a hundred or more round mounds and conical hills, whose tops are strewn over with rocks and long angular fragments, presenting a singular appearance, with Mount Shasta rising his hoary head high in the heavens. The agricultural lands lie in narrow belts on either side of Shasta River and along creeks which come down from the mountains.

This valley is well adapted to grazing purposes. During the winter season large bands of stock find pasturage among the hills and along the creeks. The flourishing city of Yreka, the largest north of Marysville, is located in a long, narrow valley, near the lower end of Shasta Valley, and the extraordinary yield of the mines in that vicinity and further west has given it a long and continued prosperity.

Yreka is a pleasant inland city, and in the suburbs of the town are neat dwellings, surrounded by luxuriant fruit and flower gardens, and everything necessary to render a home pleasant and happy. The streets are wide and regular; the hotels, stores, and business houses present a scene of lively activity. In education and morals the citizens have wisely taken a deep interest, and deserve credit for having good schools, fine churches, and able ministers.

Scott Valley, the queen of all the valleys in Northern California, is not only one of the most healthy but one of the most fertile and picturesque valleys in the State. It is located in a mineral section of country. It is about forty miles long, and will average four miles in width, though near the centre it widens to ten miles or more. About half way of its length on the west side, where the main valley begins to contract, there is a mountain in the shape of a triangle, four miles long, which commences to rise gradually from the valley towards the north to the hight of a thousand feet, where it terminates abruptly. At the northeast corner of the mountain, near Fort Jones, the valley and river bends sharply to the west, and leaves the narrow valley of Oro Fino on the west side of the mountain, which opens out into the main valley to the northward. Parallel with Oro Fino Valley on the west is Quartz Mountain, extending north and south six miles, and is attached by a low divide to Salmon mountains. Quartz Valley begins on the west side of the low divide near the Pinery, and is two miles wide, and opens out into the main valley at the lower end, where the river enters the mountains. Scott Valley may be considered in its outline form like a triangle. It contains many thousand acres of rich agricultural and grazing lands, and the surrounding mountains contain rich lodes of metaliferous rock. The scenery is truly beautiful and picturesque. The rich alluvial soil, dotted with pleasant dwellings and the homes of families, present a scene of comfort that is truly enviable. The soil on the upland near the foot-hills is composed in part of gravel and sand, hence the roads are pleasant and smooth at all seasons of the year.

This valley is well watered by streams, affording an abundant supply of water for the many herds of cattle, sheep, and swine that feed on the hill-sides and in the valleys. Following these streams, as they rush down the precipitous mountain sides, and then winding their way to the foot-hills, they afford many fine mill privileges. There are five flouring mills and ten saw-mills located in different parts of the valley, which supply the citizens of the valley with flour, and fencing and building lumber.

On the west side of the valley is a dense forest of large pine, fir and cedar timber, from half to a mile in width, stretching the whole length of the valley. To the eastward of the valley the foot-hills and low ranges of mountains stretch away towards Shasta valley, through which Moffitt's Creek winds around from the southeast and enters the valley at Fort Jones. These foot-hills furnish a fine range for grazing purposes, and abound in beautiful open groves of oak and fine timber. At the lower end of the valley, where the river enters the cañon, the mountains rise abruptly, towering in wild confusion above the clouds, and clothed in the habiliments of snow, while deep in the valleys below rushes the overflowing waters of Scott River!

Scott Valley is the Eden of Siskiyou county. The checkered fields are finely fenced, and at little intervals comfortable farm-houses and orchards attest the result of the laborers—of the tillers of the soil. This valley is the home of a thrifty and rapidly increasing population, devoted to rural and mining pursuits.

The villages of Oro Fino, Rough and Ready, and Fort Jones have grown up in different parts of the valley, and are prosperous and will continue to thrive with the energy and industry of the intelligent and hardy farmer and miner. They have a rich county to support them, in productive soil and undeveloped mines, which will last for years before they are exhausted. In my next I will give an account of the mineral resources of this county.

MANY, if not most, of the presidents and professors of our leading colleges have united in a memorial, looking to the adoption by this country of the decimal system of weights and measures now current in France, Holland, Belgium, Spain, Italy, and some other countries. They propose to begin by having it explained and analyzed in all our arithmetics.

THERE have already been organized sixteen hundred and thirty National Banks, with an aggregate capital of four hundred and nine millions. The total amount of circulation up to the present time is two hundred and sixty-two millions of dollars.

REPORT

ON THE

Mining District of BATOPILAS, in the State of CHIHUAHUA, MEXICO.

[Extracts from a work just issued from the Mining and Scientific Press Job Printing Office.]

(Continued from Page 149.)

EL "PYRAMO,"

Which, while giving metal in several small workings, crosses a solitary huge stone or cliff, sticking out to the height of some sixty feet from the side of the hill. In this, near its summit, was found a considerable quantity of massive silver, following which the whole of the rock was traversed, causing a hole which resembles a window, from which there is a magnificent view of the valley below and the mountains opposite.

LA "TRINIDAD,"

Of recent date, was first discovered by gambusinos. It got later into the hands of Don Francisco Viniegra, who, prospecting it merely for some thirty varas, took out some $25,000. Part of this ran in excellent metal, up to perfectly native silver of two and three inches thickness. I saw a single stone, a few years ago, that came from it, which was valued at and sold for over $400.

This claim was soon after purchased by an American Company; but they failed to prosecute the work vigorously, although it certainly gives the very highest promise, if a tunnel should be run, cutting all the lodes some distance below their present works, and these, besides, prospected above at different places. The metal emanating from this district is, besides the visible native silver, exceedingly rich in sulphurets.

THE "ROSARIO"

lays on a spur of the same mountain, very near by and north from the foregoing. It is a new and almost virgin mine, having only a small shaft of fourteen varas, which gave to its late owner, Don Ventura Avencino—a Spaniard who died a short time ago—over $16,000, principally in the richest kind of sulphurets, intermixed with solid silver. It is now held by Mr. James Jacques, but not worked at present, although it holds the well justified hope of very rich rewards, laying throughout in first-class mineral grounds.

LA "DESCUBRIDORA,"

Another great bonanza mine of the last century, is on the same mountain, a few hundred yards lower down.

Of this mine, at present entirely filled up with rainwater, and therefore unaccessible, is only known that it gave, in years long gone by, very great treasure, the amount of which is now lost.

The last one who worked in some of its upper works was the late Don Marcos Viniegra, who, about thirty years ago, took out considerable silver therefrom, but did not get down to the old bottom. It might however again be opened by means of a tunnel, which could be driven on the lode.

Besides these, there are quite a number of other mines and lodes, some of which have been merely picked at, and contain at least very inconsiderable works. Others, as yet, entirely virgin. The majority of such as are favorably looked upon, lay in good mineral ground, and need only some judicious outlay of capital and prospecting in order to show what they are worth.

Among them rank:

The "Nuestra Señora," on an eastern spur of the "Cerro de Animas," giving very rich earths near the surface.

The "Camuchin" and the "San Antonio de los Tachos," both of which are on a spur to the west of Batopilas. They are old mines, now filled up with water, but have given very rich returns, the latter one especially, in chlorides and earths, *(tierras)*. They could be easily drained by a short tunnel, and profitably rehabilitated, as their general features promise very highly. The "Sacramento," a vein of considerable size; the "Todos Santos," the "Gavilanes," and others on a hill in front and southwest of the "Pastrana" and "Arbitrios" mines; the "Providencia" and the "Cobriza," both on the same spur of and above the "Arbitrios," in fact, the latter belonging to its claim, and said to be on the same lode.

The five latter ones have given rich pockets of chlorides and native silver, on or near the surface, but no work has been prosecuted on them since those gave out, and are therefore almost virgin.

CONCLUDING REMARKS.

I will now add a few further remarks on the profitability of investments and mining enterprises in Batopilas.

First.—*Old Mines*, celebrated for their great mineral wealth, being generally filled to a great extent with water and rubbish, or mud, require considerable time and a corresponding capital to clean them out, and sink after that through the intervening space below their bottom, in order to get anew into the continuance of the silver deposit. They give, however, almost the assurance of another rich reward, if the work is reasonably persevered in. Companies undertaking such, must be prepared to remain out of their capital for at least from one to two years.

Second.—*New Mines, or Virgin Veins*, do not require much capital for the first year's work, as a shaft must be first sunk to a depth of from twenty or thirty varas before silver can be expected in sufficient quantities to justify driving levels on the lode. An outlay of from $75 to $100 per week would be sufficient to pay for this work, as hardly more than six or eight men at a time can be profitably employed in a single work. Under all circumstances it would be advisable to have a capital of not less than from $5,000 to $10,000 paid in for working purposes

Third.—*New Mines*, that have already been opened and yielded some, hold out a great security for an enterprise upon them, provided they lay in good mineral ground. But all such must be purchased, and cannot be had for less than from $25,000 to $50,000. Besides these funds, there should be a reserve, or working fund, of $10,000 in cash, to enable the party to carry on works without being cramped.

It is necessary to have sufficient means on hand to buy provisions when cheap, for the support of the workmen, saving sometimes from 15 to 50 per cent. in this way.

It is well to get out a large quantity of ore before commencing the amalgamating work; and further, to be able to hoard up the silver bullion until there is enough to send directly to the mint at Alamos.

Nature, in some minerals, has formed very wide lodes, giving ore of small *ley*, whereas here the precious metal is concentrated in rather narrow veins, but giving as much in one cubic yard, as would be contained in ten cubic yards in other districts, where the lodes are wide and the ores poor. For, as I already stated in a previous chapter, the metal of Batopilas ranges up from, never less than $100 to $500, and thence to $5,000, $10,000, and $20,000 to the ton.

Mining companies wishing to purchase mines, and engage in enterprises in Batopilas, should be very careful in choosing agents to examine them. They should be men well versed in mining, mines, ores, and metalurgy; men who have travelled through and over the Sierra Madre range of mountains, or they may grow faint at heart long before they arrive at the mines. Otherwise, the newly arrived agent, fatigued and prejudiced against the country on account of its rugged appearance, will have made up his mind, long before entering a mine, that it is too far away from civilization.

In my opinion, there is hardly another mineral district existing in Mexico, which offers inducements equal to Batopilas, and the time must, by the very force of circumstances, be near at hand, when its ancient fame shall revive and spread anew.

We have every reason to be confident in our belief, that within a few months several of the claims will enter into bonanzas, each of which may, and very likely will, turn out many millions of dollars—the "San Miguel" claim, for instance, the "Santa Teresa," the "San Nestor," and the "Pastrana." Two of these, the "Santa Teresa," and "San Nestor," are already actually in such.

What an extraordinary stimulus these will give at once to the other enterprises is easily understood; and let, after that, mines like the "Arbitrios," "Cata," and others, come in with their treasures, which they may do before a long time expires, the silver produce of Batopilas will astonish the world, and mining property rise immensely in value.

For, if in earlier days, with their scanty means and implements, the Spaniards took out hundreds of millions, and these merely, so to speak, from the surface, *what should not then reasonably be expected from our actual facilities, enterprise and capital, after once fairly opening and prospecting these almost virgin lodes?*

Everything, in fact, goes to prove that Batopilas contains yet silver enough in its mountains to satisfy our wildest dreams. Where there is grass growing above, there must be roots below to feed it.

In regard to the political troubles that this country is laboring under at present, we may safely hope that they will soon find a satisfactory solution. As yet, they have not interfered in the least with our interests here, and probably will not for the future, as it is, and must be the policy of the contending parties to foster, rather than to disturb them.

Having nothing further to communicate for the present, I remain

Your Respectfully,

A. E. KOELS.

[Extracts from the Seventh Annual Circular of the Miners' Foundry—Now in press in the Mining and Scientific Press Job Printing Office.]

MINING INTERESTS.

From the Mining Review for 1865, *in the Mercantile Gazette and Prices Current.*

This event (the discovery of gold on this coast), like many other important discoveries, was the result of accident; and though it failed, as often happens in cases of this kind, to enrich the party making it, it produced at once a marked effect upon the trade, industry, and financial aspect of the whole civilized world. The energies of the nations were aroused, emigration was excited, new channels of transportation and travel were opened, and new enterprises were set on foot—every interest and department of labor being made to feel its quickening and invigorating influences. The finding of gold in California having awakened public attention to the subject, led to its discovery soon after in Australia, and finally in Oregon, British Columbia, and elsewhere, until there is not at present a State, Territory, or perhaps even a province, west of the Rocky Mountains, in which it has failed to be found in remunerative quantities. That the potency of this new agent is tending to revolutionize the financial and industrial affairs of the world, may be inferred from the fact that the product of the precious metals during these eighteen years, upon this coast alone, has added nearly one thousand millions of dollars to the stock previously in existence; the contribution from this source being at the rate of more than fifty millions per annum. * * * * That this rapid enlargement of the standard measures of values, and medium of exchange, should be attended by a corresponding expansion of prices, and an unwonted excitation in every department of business, was not only natural but inevitable. Hence the advance in the prices of property and labor, the impetus given to every branch of industry, whether speculative or practical, and the general activity, mental and material, seen the world over, together with that love of exploration and adventure which this condition of things has tended to nourish, and which has found its most marked development in our own people; and however the business of mining may fluctuate, or fail to prove remunerative in certain cases, it must always continue, as it has heretofore been, a leading pursuit, not only in this State, but upon the entire coast of the Pacific. * * * * The receipts of uncoined gold and silver in the city, through public channels, during the past year amounted to nearly $49,000,000 as against $48,000,000 in 1864. In 1863 they were less than $44,000,000; in 1862 not quite $42,000,000; and in 1861 just about $40,000,000. During the last twelve months the area of our metalliferous territory has been considerably extended, while many mills and reduction works of large capacity have been put up in various parts of the country. The greater portion of these have not yet commenced operations, or been running sufficiently long to tell with much effect upon the product of the year just closed. Another season they will increase in the annual product materially. Besides this, the business of mining promises to be carried on hereafter with more system and economy, not to say honesty, than has hitherto characterized it as conducted in certain cases. The plan of working mines with a view to enhance or

depress the prices of stock, as might best serve the interests of those having control of them, is not likely to be practised to the same extent as formerly, it threatening to prove nearly as dangerous to those engaged in carrying it on as to their intended victims. That this business may speedily be purged of this and all other abuses is greatly to be hoped, since to it we must continue to look for those large and certain revenues which have thus far never failed us, as they are not likely to do, our mines being vast in extent and literally exhaustless. * * * * Wherever it has been carried on in a legitimate manner, being conducted with the same discretion and care evinced in most other callings, it has generally proved a success; the failures mostly being attributable to lack of skill, extravagant expenditures, or some other sort of mismanagement.

EXTENT OF THE MINING FIELD.

We have now within the American possessions, west of the Rocky Mountains, three States and five Territories, embracing an area of more than one million square miles, the whole of which may be considered a mining country. Not that every part of this vast region is metalliferous; there being large tracts of it in which the precious metals at least have not been met with in any considerable quantity Still, scattered everywhere over its surface are districts abounding in not only these but also in nearly every variety of the useful metals; the latter, in some one or more of their varied forms, being nearly everywhere present. To what extent this region is metal bearing has as yet been but partially determined; its magnitude, and the difficulties attending its exploration, having precluded a thorough examination of more than a small part of it. Of that portion lying within the limits of California and Nevada, with which we have become most familiar, it can be truthfully said that the more it has been explored the greater appears to be its capacity for yielding, under the conjoint aid of well-directed labor and ample capital, large amounts of gold and silver. It is now perceived that the placer mines of this State, liberally as they gave up their treasures at first to the simple and inexpensive processes employed for working them, formed but the husk and chaff, as it were, of our real and more substantial mineral wealth, hid away in the vast repositories of auriferous quartz found in every county that flanks the Sierra; while the further the work of prospecting has been carried into the wilds of Nevada, Utah, and Idaho, the richer and more extensive have been the discoveries made, establishing, to all practical intents, not only the illimitable bounds, but also the inexhaustible character of this field of labor.

PLACER OR SURFACE DIGGING.

To the placer miners of California the past year has been one of general success, the supply of water having been better than usual, and the season every way favorable. There is no question but the aggregate yield from this source has been larger the past than for several years immediately preceding, though we have not the means of ascertaining the exact amount taken out during this time. Besides the causes mentioned above, there have been others lately brought into operation tending to swell the product of this class of mines—such as larger numbers engaging in them; the discovery of new diggings; the re-opening and working over with greater care, or by improved appliances, of old ones; penetrating further into the gravel deposits; larger crushings from the cement beds, and a general enlarging of the area of the mines, coupled with a more efficient style of machinery, greater economy, and more careful manipulations of the auriferous earths. * * * * Coming into Tuolumne and Calaveras, and passing thence through the tier of counties that lie against the western slope of the Sierra into southern Oregon, we find the work of placer mining being vigorously and intelligently prosecuted, in all its different branches; and aided by all the auxiliaries that capital can command, or that ingenuity has been able to invent, or science supply. Here we have every variety of mining, and see at work the many devices contrived for diminishing labor and saving gold. The several styles of sluices, the hydraulic washings, the long tom, and in some instances the still more primitive pan and rocker are all encountered, and the hill, gravel, dry, river, tunnel, and cement diggings are seen in every stage of development. By passing over to the sea shore, in Klamath County, we can even witness the operations of what is known as "beach mining," carried on in the vicinity of the once famous Gold Bluff. To describe these different kinds of mines, and the various appliances and modes adopted in furtherance of this business, would require more space than could well be spared; suffice to say, the latter are nearly all the inventions of practical miners, called forth by the necessities of their business, or suggested by experience, and that water is the principal agent employed in separating the gold from the earth and gravel in which it is imbedded, these contrivances being simply used to apply it more effectively. It is in the central and northern portions of the State that we find the principal hydraulic washings, and here too are the blue gravel lead and cement deposits, marked features of that section, from all which large quantities of gold are annually extracted. The supply of water furnished by the late copious rains having enabled the miners to get to work early in the season, there is much activity evinced throughout the placer diggings, and with timely rains from this on till the dry season sets in, the product from this source will undoubtedly prove individually remunerative, and in the aggregate large.

QUARTZ MINING.

While in the province of placer mining the new discoveries being made are few and unimportant, and the diggings already found are being gradually depleted, the area of the auriferous quartz is being constantly extended, every year adding steadily and largely to the yield derived from this source. In magnitude the quartz region of California is already even more than commensurate with that of the surface mines, and in general terms may be said to reach from the Clear Creek District, in the southern extremity of Tulare County, to the northern line of the State, a linear distance of nearly five hundred miles. In breadth it varies from ten to a hundred miles, giving an aggregate area of at least twenty thousand square miles, over which these metalliferous lodes are scattered, some districts containing them in great numbers, and others more sparsely. These lodes do not abound in all parts of this extensive territory, but lie in groups or spots, sometimes widely separated, the intervening country being comparatively barren, or containing veins of little value. In some sections, too, the quartz is much more highly auriferous than in others, the smaller and more regularly shaped veins, as a common thing, carrying the larger per centage of gold. As is usually the case with auriferous lodes elsewhere, those of California generally have a north-westerly and south-easterly strike. In thickness they vary from a few inches to as many feet, being in some instances of a much greater size. Ledges a hundred feet thick are not uncommon, but this class are not ordinarily composed of pay rock throughout; in fact are apt to have what gold they do contain so diffused throughout the mass as to render it valueless. It would almost seem as if nature had allotted a specific amount of the precious metal to each ledge, the large and small alike, thereby rendering the working of the latter a much easier matter than the former, the amount of rock requiring to be reduced being so much less in order to secure an equal amount of gold. The large sized ledges, however, often contain streaks and pockets that prove very rich. The dip of the lodes in this State is almost uniformly towards the east, some of them having a high and others a low inclination. Some of the richest veins stand nearly perpendicular, while others lie almost flat. In length they are equally and even more variable, being traceable sometimes for miles, while again they can be found only for a few hundred feet, or perhaps less. The position of the quartz belt of California is longitudinally through the center of the State, embracing the foothills of the Sierra Nevada Mountains. It has an altitude varying from one to five thousand feet above the level of the sea, reaching at a few points to a greater height, but not often found below the line of elevation first mentioned. Towards its southern limit this belt trends to the east, and crossing the Sierra Nevada chain has its extremity in the Owens Valley country; while in the opposite direction, following the straggling spurs of this same range, it sweeps to the north-west, and terminates on the shores of the Pacific, a portion continuing on into southern Oregon. At one time it was thought there was no quartz in the more elevated portions of the Sierra Nevada, but this has since been found to be a mistaken opinion. More recent explorations have brought to light extensive districts containing lodes of this rock, highly impregnated with both gold and silver. The Kearsarge District, in Tulare, and the Excelsior, in Nevada County, with several of less importance situate between them, but all lying high up the sides, and several quite on the summit of the Sierra, disprove this theory, and go far toward warranting the belief that these mountains may yet become the theater of large and profitable mining operations. * * * * Aided and stimulated by the liberal investments being made, there is now much prospecting going on, both in the way of opening ledges already located, and in searching for new ones. In most cases miners who dispose of their interests employ the proceeds in prospecting for others, or in working the claims they may still own.

The quartz mills throughout this State vary in capacity from three stamps to fifty; the number contained in the mills built at an earlier day generally running from five to twenty. Lately the number has been larger. Most of the mills are employed in crushing rock from the ledges belonging to their several proprietors; and hence there is in many districts a need for mills to do custom work. It is usually estimated that each stamp has a capacity to crush one ton of rock in twenty-four hours. The earnings of some of these mills and mines are enormous. The average monthly yield of four mills on the Fremont Mariposa estate was over $60,000. The net earnings of the Crescent Company, Plumas County, have been at the rate of $100,000 per annum, while, as we have already seen, many of the leading mines about Grass Valley have produced still more munificently. The total yield of the Allison Ranch Mine at that place, since operations were first commenced upon it, has exceeded $2,500,000; the group of claims on Massachusetts Hill have turned out about $3,500,000; the North Star and other mines on New York Hill have yielded $2,500,000, and the Norambagua alone $1,000,000. The complement for Gold Hill has been $3,000,000, and for the Lone Jack Mine, Ophir, Deborque, and Ilueston Hills, the aggregate has been fully $3,500,000. The product of the Eureka, during the past two years, has exceeded $500,000, its earnings for the month of December last alone having been more than $43,000. The aggregate amount of gold taken from the quartz mines within the limits of the Grass Valley District since 1852—thirteen years—has been at least $20,000,000. In corroboration of the substantial correctness of this statement, we find, after a very careful examination of all the records and other data at our disposal, that the aggregate yield of Grass Valley, during the past thirteen years, has been about $28,000,000, including all the receipts from the surface mining claims in that region. From these latter sources the most reliable statistics show that about $8,000,000 has been obtained, leaving $20,000,000 as the probable product of the quartz mines since 1852. This is believed by many well informed parties to be too small an estimate, but wishing to be within bounds we conform to the above figures. During the past year the quartz mines of Grass Valley have yielded about $3 300,000, or an average of $275,000 per month, and the coming year is likely to show a product of more than $4,000,000. The Sunbeam Mill, Tuolumne County, turned out at the rate of $50,000 per month when it first started, and although it did not keep up that yield, has earned vast sums most of the time since. A large number of mills of ordinary capacity might be mentioned that for years have steadily earned from $10,000 to $20,000 per month. Most of these mills run night and day. Immense sums have heretofore been and are still being lost in the working of quartz, from inability to separate the gold, by the ordinary modes of treatment, from the sulphurets of iron and copper with which it is combined. Many efforts are being made to meet this difficulty, some of which have been partially successful, and there is reason to hope that the desideratum will be supplied at an early day. About two-thirds of the mills in California are propelled by steam, and the balance by water, the latter generally being those of inferior capacity. The most of them run night and day, stopping only for repairs or on Sunday.

The business of quartz mining upon this coast is not confined to California, there being a great number of ledges in Nevada, Idaho, and in fact throughout all parts of our Pacific possessions, that are now being or will hereafter be worked by a simple gold-saving process, that metal, while there is always a small per cent. of silver present in the rock, greatly predominating. The bullion obtained from this class of ledges is worth from $0 to $14 per ounce.

SILVER MINES AND MINING.

While California has within her borders a considerable number of what may properly be termed silver-bearing lodes, she has as yet produced but little of this metal, the bulk of it having come from the mines about Virginia City, and other localities in the State of Nevada, where the business of mining for it is extensively engaged in. The yield of that State for the past year amounted, in round numbers, to $16 000,000, the same as the year before; the entire product of that region, since the discovery of silver there in 1859, being estimated at about $40,000,000.

AMOUNT OF BULLION TRANSPORTED BY WELLS, FARGO & CO., FOR 1865.

The following is a statement of the amount of bullion received, exclusive of coin, from the different mines of the Pacific Coast, at San Francisco, from January 1st to December 1st, 1865, by Wells, Fargo & Co's Express Company:

From Northern Mines	$10,620,436	Estimated for the month of December:	
From Washoe (Virginia City, Gold Hill, Silver City, etc.)	14,074,461	From Northern Mines	$1,764,000
From Reese River Mines	773,076	From Washoe	1,000,000
From Southern Mines	4,707,274	From Reese River	77.000
From Portland (Idaho Mines, etc.)	4,510,096	From Southern Mines	375.000
From Victoria (Carriboo, Fraser River, etc.)	1,469,061	From Victoria	272.000
		From Portland	500.000
Amount received	$45,245,004	Estimated for December	3.988,000
		Amount received	45,245.004
		Total	$49,233,004

SODIUM AMALGAMATION.

Numerous inventions have been devised to prevent the loss which often attends the best conducted operations, and avoid the causes which involve it; but until lately with very indifferent success.

It has been ascertained by repeated trials that the use of a minute portion of the metal sodium, has the power of destroying the action by decomposition of all substances which have hitherto proved so serious a difficulty in bringing the gold into contact with the mercury.

The sodium, from its decomposing power, preserves the quicksilver in a pure and active state, so that, when introduced into the battery, or pan, amalgamation takes place with great rapidity. The quicksilver, from the motion of the stamps or muller, is projected against the cast iron sides, and sticks there as perfectly as it has heretofore done by the troublesome process used in galvanizing copper plates.

For galvanizing copper plates nothing has as yet proved anything like its equal. No washing by nitric or other acid is required. It is only necessary to rub the sodium amalgam on the plate.

For amalgamating in pans, the sodium amalgam should be dissolved in the mercury, in the proportion of two ounces of the former to five pounds of the latter, one hour before being put in. For amalgamating in the battery, the bottle containing the sodium amalgam should have a buckskin cover tied over its mouth, through which the amalgam is sifted into the mortar, through the feed opening, which operation requires to be repeated every half hour. A preliminary experiment or two will serve to illustrate the remarkable properties imparted to mercury by sodium.

1. Shake up, in a test tube, a small quantity of mereury, say half an ounce, with a moderately strong solution of sulphate of iron. The mercury is presently reduced to the condition of thick mud, being so completely granulated (floured) as to resist all efforts to restore it to its proper condition, and retaining this condition almost indefinitely. Drop now a minute particle of sodium amalgam into it, when instantly the whole is restored to its fluid state, and subsequent efforts to reproduce the granular condition are futile if the least trace of sodium remains.

2. Bring a small particle of placer gold, or gold from quartz, into contact with a little clean mercury, in its ordinary condition. It will be seen to push the gold before it as it rolls about, and refuse to amalgamate with the gold, even when beneath its surface. In fact there seems to be a sort of active repulsion between the two metals.

3. Bring the same particle of gold into contact with mercury having a minute portion of sodium amalgam dissolved in it, when immediately the gold is completely enfilmed by the mereury and disappears under its surface.

The Sodium Amalgam, as well as the metal itself, ready for use, may be obtained in any quantity desired at the Miners' Foundry, or of H. P. Wakelee, Druggist, corner of Montgomery and Bush streets, San Francisco, California.

Mining Summary.

CALIFORNIA.

SISKIYOU.—The reader will find, in another column of to-day's issue, a very interesting letter on the mineral and other resources of Siskiyou county. We clip the following report of a new and remarkably rich discovery in this county from the Yreka *Union* of the 3d inst:

The newly discovered quartz mines in Scott Valley are situated in Cedar gulch, on the west side of Scott river, between Sugar creek and Squaw gulch, and about five miles in a northwest direction. The mines were first discovered by George Scolds, who immediately went to work extracting the rich gold-bearing quartz and packing it in flour sacks upon his back, across the hills to his cabin in the gulch next below. He was discovered at this by some miners working in the vicinity and, from his actions, thinking that he must have a "good thing," they watched him until he returned to his lode and found that he had struck a vein of the richest gold-bearing quartz that has ever been found in Northern California, or perhaps in the State. The vein can only be seen at the point where it was first found, in a small tributary of Cedar gulch, for the reason that the bed rock on both sides, and, in fact, throughout the whole gulch, is covered from two to forty feet in depth with earth. Scolds has only opened his lode about ten feet in length and from one to three feet in depth, and has taken out rock variously estimated by those who have seen it, to contain from four to six thousand dollars. The vein is only from two to six inches in width where it has been opened, but appears to be gradually widening as it goes down, and the rock will yield from three to ten thousand dollars to the ton, and some is still richer—being more than half pure gold. Scolds, to prevent his rock from being carried off by curious prospectors, has sluiced his prospect hole full of mud, while he has started in below the lode to bring up a drain that will tap it at about the depth of fifty feet, which will probably be completed in about a week, when the question whether the lode is extensive or not can be determined. Other parties are running tunnels on the line of the vein in anticipation of striking it.

SHASTA.—According to the *Courier*, the Potosi company, at Muletown, will have their mill running in two weeks. The Eureka company are prospecting their lodes—one called the Pettit, another the Eureka, and another the Mount Shasta—all within a half mile of the Potosi mill, and are getting splendid prospects, so far, finding rock like the Potosi, which all concede to be rich enough. From present appearances, Muletown will be a leading quartz mining camp in the county, contesting, if not carrying away, the laurels from French Gulch.

Mr. L. A. Kelly, at Lower Springs has put up one of Wheeler & Randall's prospecting mills, at the Union mill, which he proposes to run for prospecting purposes for the benefit of the public, hoping thereby to do something to develop the value of some of the numerous ledges in that vicinity. Attached to this mill is a set of pans and separators of proportionate dimensions, and all the appliances for testing gold or silver-bearing rock, concentrated tailings, sulphurets, etc. The mill and machinery is so arranged that the customer can witness and watch the entire operation. Mr. Kelly offers the use of his mill to the public, more for the purpose of inducing prospectors to open and develop their ledges, than with the view of any pecuniary profit to himself. Such mills are needed in every mining district on the coast, and whenever put in operation, can scarcely fail to be of good service. These mills have a capacity for working about two tons of rock per day.

PLUMAS.—We condense the following from the Quincy *Union:* The Howell quartz mill, at Round Valley, has stopped running for the present. It will start up again soon.

The Eureka quartz mills have been sold at Sheriff's sale, under execution. John Parrott, of San Francisco, was the purchaser.

At Twelve Mile Bar, water is plenty, and the miners are making good use of it. Droge, Kiser & Co., are running two sets of pipes, and are making a big "hole" in their claim. Richards & Ball's claim, in Rich Gulch, is paying well. Nipher's company is also getting good pay. Hallsted, Davis & Co., on Terry Hill, are working day and night, and will have an acre (more or less) of bed rock to clean up after the water gives out. Hyde & Ward, on Twelve Mile Bar, are working several hands, and their claim is paying well.

ALPINE.—According to the Silver Mountain *Bulletin* there are at this time eleven claims in that immediate vicinity in active operation, viz: Champion, General Grant, Illinois and California, Pennsylvania, Mountain, George Washington No. 1, Balaclava, Scandinavian, Buckeye No. 2 and Mary Frances. There are a number of other claims lately re-located, upon which work is being prosecuted. From present indications, we have a lively season ahead.

The Baloclavo company are still running in their ledge, and the ore is improving daily. From present appearances they will have milling ore by the first of May.

The Rippon, under the superintendence of of Mr. W. Brown, have their tunnel in 360 feet, and from the large volume of water which is running out of the same, they are supposed to be near their first ledge. It is to be hoped for the interests of the district, as well as for that of stockholders, that litigation has ceased, and that in the future the managers will attend to their legitimate business—mining.

The Champion company, located about two miles south of Silver Mountain on the Big Tree Road, is at work running a tunnel in the casing, parallel with the vein. They are in about seventy feet, and have cut the ledge, occasionally, but refuse to exhibit any of their rock, which, says the *Bulletin*, leads many to infer that they have a big thing.

PLACER.—A correspondent writes from Todd's Valley, under date of March 13th, as follows:—"Permit me to inform you that Geo. G. Barnes, Esq., editor of the *Morning Call*, and myself, saw cleaned up, in the Dardanelles Cañon, half a mile below the place where they are sluicing, five hundred ounces of amalgam, (eighty days' run). They use R. H. Dunniug's Patent Under-Current Sluice, or Gold Separator, for saving the fine particles of gold. This company have used the 'Under-Current' about five years. They say they would not be without them for anything. Out of their lower Under-Current, away down in the Cañon, they took out over $300. There are many new companies using the Under-Current in this section of country. They all say they are invaluable. The proprietor has recently appointed Mr. John Hemsley sole agent for Idaho and Montana for this invention.

"Hard cement is all the go here at present. There are four mills for crushing cement being erected between this place and Forest Hill, (distance from here to Forest Hill three miles), ten stamps each, with a capacity of ten stamps each more if needed. The Boston Company had five car-loads crushed at the Baltimore Company's mills one day last week, which paid $200. One-fourth of the Dewey claim, at Bath, was sold this week for $1,200—the whole claim is only 200 feet front. This mill has been running about two years; it is paying well. There is cement enough on this divide to last for fifty years to come."

The Dutch Flat *Enquirer* reports the discovery of some very rich quartz ledges, about fifteen miles from that place, between the American and Bear rivers. Several locations have been made, and the fortunate prospectors are exceedingly sanguine with regard to the value of the mines. They seem to be of opinion that the croppings are unsurpassed in richness by any in the State, and we only trust that all their hopes may be realized.

The Placer *Herald* is informed that the company owning the Layue silver claim have made arrangements to erect a mill this spring, and work the lead regularly. The ledge is well defined, and is said to yield handsomely by working process. Some of the successful Washoe operators have taken an interest in the company.

CALAVERAS.—The Copperopolis *Courier* speaks in glowing terms of the future prospects of Calaveras county. More attention is paid to gold mining than formerly. The copper mines of this county, although more valuable and extensive than any yet discovered elsewhere in the known world, cannot be said to be more valuable than the gold. They produce a hundred thousand tons per annum, or more, yet the gold mines of the county are destined to eclipse them in wealth. The *Courier* anticipates a lively time when the railroad is completed through Copperopolis to Mariposa, whither it should go.

The number of mining ditches in Calaveras county, according to the report of the Surveyor General, is fifty-eight; miles in length, 594; total value, $120,000. Calaveras ranks as the first county in the State in the number of ditches, second in value, and third in aggregate length.

The Keystone mine promises to yield largely the coming season. A large amount of ore has been taken out during the past month.

We condense the following from the Monitor *Gazette*:—A lot of ore from the Mullan lead sent to the Pioneer Mill for reduction, returned a most satisfactory result. Another test of ten tons was to be made.

The affairs of the Winchester company, both pecuniary and otherwise, are said to be flattering. The recent assessment has cleared up all debts, and the stock is now held by parties who will prove the value of their property at the least possible expense.

Work upon the Leviathan is suspended for the present, for reasons elsewhere given.

It is reported that a small lot of 100 tons of ore from the Morning Star has been crushed at the Yellow Jacket mill, and yielded at the rate of a fraction over $600 per ton.

An organization, under the name of the Gordon Company, having obtained title to the claim at the lower end of Main street, formerly known as the north extension of the Little Monster lode, have been busily engaged in opening the same this week. Some very fine specimens of silver bearing quartz have been exhibited from the prospect, taken from just beneath the surface.

NEVADA.—We note the following mining intelligence in the Nevada *Transcript* of March 8th:—Karney & Co., prospectors, have struck some rich rock on the third extension of the Star Spangled Banner ledge. The ground of these parties is located near where the lead crosses Little Deer creek. They have only sunk a short distance, but the rock taken out is filled with free gold and rich looking sulphurets. It is said that the discoverers of this *third extension* have been offered $25,000 for their discovery.

The mining operations in blue cement, in Little York township, have been attended with unusual success this season. Quite a number of mills have been started, and all are turning out large amounts of gold. On last Saturday, after one week's run, Nice & West cleaned up $6,000, and for six weeks the yield has not been less than $3,500 per week. Brown, Malloy & Co., Williams, Cozzens & Garber, have all been doing remarkably well.

We saw some rich rock from the Union ledge yesterday. It was filled with rich looking sulphurets. We understand that the company will soon commence to sink from a new level. They are now down with the incline about 200 feet, and have a large amount of rock within reach.

According to the *Gazette*, the Pennsylvania company cleaned up from about 40 tons of rock at the rate of thirty dollars a ton. Much of the rock crushed was taken out while running a tunnel, and was considerably mixed with cab and granite.

The Grass Valley *National* says that the Heuston Hill company still continue to pay the enterprising owners large dividends. Thirty-four and a-half loads of quartz yielded $202.50 per load, a few days ago. The owners of the ledge now are A. H. Heuston, Captain S. W. Lee, S. D. Bosworth, Smith Brothers, Joseph Woodworth, and the Coleman Brothers. Capt S. W. Lee has purchased the interest of Wm. H. Rodda, one-sixteenth, and is now the fortunate possesaor of one-eighth of the above valuable mine. The interests now pay monthly dividends of one thousand dollars, and in a short time will be up to fifteen hundred dollars. The company have in their employ one hundred men about the mill and mine.

The San Andreas *Register* says that Mr. Armbruster of Petersburg, has exhibited some rock which he obtained from the claim called the Gold Hunter quartz claim, situated in Salt Spring Valley, literally filled with gold. He says the claim is about to be sold to a party from San Francisco, who will proceed to open it.

AMADOR.—According to the Amador *Dispatch*, four quartz mills are now in operation at Angel's Camp, and three new 20-stamp mills are about to be constructed.

Relative to the Copper prospects of the county, the *Dispatch* says: "We took a ride a few days ago through the copper regions of this county, and judging from the quality and quantity of ore that is being taken out, we are of the opinion that the day is not far distant when "little Amador" will be acknowledged ahead of any other county in the State in the production of copper as well as gold."

CONTRA COSTA.—A new interest appears to have recently been awakened with regard to the copper mines of Mount Diablo. Quite a number of new and promising ones have been located within the past two months, and old and abandoned claims re-located by new parties, who appear determined to give them a more thorough examination.

According to the Contra Costa *Gazette*, the Keokuk has been steadily worked ever since its location, and quite recently a well defined vein has been struck, showing a considerable quantity of good ore. Of the claims recently located, favorable reports are heard from the Tecumseh, the Reconstruction, the Nucleus, and the Wahhookon. The lode of the latter is clearly defined. A prospecting tunnel has developed a good body of ore, one ton of which has been sent to this city, sampled, assayed, and proved to be of a quality that will pay handsomely to the mine. Work upon this mine is conducted under the superintendence of Richard Williams, Esq., a gentleman of much practical experience in mining.

MARIPOSA.—The following from the Mariposa *Gazette*, may serve as a sample of extracts that might be made from the local papers of almost any mining district in the State. They all speak in the same encouraging terms. "The work on the Bear River mines is progressing finely. The rich ore is being taken out in large quantities, and a handsome profit is realized. There has never been a time since the opening of these mines when richer or better paying rock has been found. A large number of men are now at work, and business under the careful management of the present proprietors is progressing favorably, and Bear Valley is now more lively, with a prospect of continuing so for the present. Quartz is not quite 'played out,' and we are pleased to note this as one of the indications of thriving times this season."

ESMERALDA.

The Silver Peak District at this time bids fair to present, at an early day, a scene of busy activity. The mountains are filled with miners, and that region presents a wide field for the enterprising prospector. The ledges, generally, present bold outcrops, and many of them yield handsome prospects. The Silver Peak Company are going to erect a forty-stamp mill, with sufficient additional power to run the machinery of their old mill. This is the right kind of enterprise, and speaks well for the district.

The editor of the Esmeralda *Union* says that Mr. Mack, of Aurora, has shown him some specimens of copper ore, which were taken from his mine, about three miles from Castle Peak, in Mono county, Cal., which will compare with any copper ore we have seen. Among the selections are some fine pieces of native copper. The company are still prospecting and working their ledge, and feel confident that an immense amount of good paying ore can be obtained.

HUMBOLDT.

The *Register* says that Mr. Fall has again commenced work on the Chameleon claim. Float ore from the surface paid about $160 to the ton, silver. If Fall finds the ledge of good size, and composed of such stuff, it will be a capital mine, as it is advantageously situated for working.

The Monroe Series continue to turn out amazingly rich quartz, appearing to improve in width and richness at the same time. We are told that the workmen are taking out quartz now, regularly, which will yield $1,000 to the ton, gold. Down a little more than eighty feet.

Some two months ago, a small lot of ore from the Jersey ledge was worked in Stevenson's mill, and the crude bullion taken to Virginia. It was worth, in that shape, a trifle over fifty cents the ounce. Some of the papers got it fifty cents the pound, and the item now comes back from the New York papers fifty cents a pound.

VIRGINIA CITY AND VICINITY.

Peavine district is reported as attracting considerable attention, and when the railroad extends that far, it is expected that large quantities of copper ore will be freighted down, and will return rich dividends to the miners, who as yet have been laboring under great disadvantages.

The Virginia *Enterprise* says that Messrs. Hurst and Fay have just arrived in Dayton with about one ton of ore from a new district located some fifty miles southeast of Columbus district. The ore will be worked at Carpenter's mill, and is said to be extraordinary rich. A small lot brought in some time since from the same lead yielded by mill process $740. This last lot is supposed to be still richer. The country about the mines is barren in the extreme sense of the word.

There is a rumor abroad that something pretty good has lately been struck in the Hale & Norcross in addition to the strike chronicled a short time since.

An addition to the amalgamating capacity of four new pans has lately been made in the Central mill. None but the richest ores found upon the Comstock lead are worked in this mill, yet it has never lacked ore for crushing. The Freiberg process—the one used—is too expensive for common ores.

The *Enterprise* says that during the past week or two the bullion shipments from the State of Nevada, have been larger than ever before in its history. The mines are yielding an abundance of rich ores—they are "giving out" in the lower levels just as we desire to see them continue to do.

A WRITER in an exchange, whose plums had suffered by the *curculio*, cut a sheep skin in wool, into strips, dipped into petroleum, nailed them about the trees two feet from the ground, and had nice ripe fruit.

A DAY AT THE LINCOLN SCHOOL.

We had the pleasure, on the 5th inst., of visiting the Lincoln School, located on Fifth street, near Market; and a pleasanter or more suggestive visit it has seldom been our fortune to enjoy. This School is under the direction of Mr. I. G. Hoitt, as Principal, aided by two male and fourteen female assistants. The School is devoted exclusively to boys and the number of pupils enrolled is 906, divided into sixteen classes.

Each class is divided into two divisions, according to the proficiency of the pupils in their studies. Exercises in gymnastics are given daily in several of the classes.

The new school house yard is divided into two portions, smoothly planked and arranged with benches and sheds upon their sides; the latter as a shelter from the sun and rain. At the hour of opening the school the boys are all required to assemble in the yards and at a signal, each class, headed by its Captain and two Lieutenants, form in line, arranged according to the order of their station in the class-room. By orders subsequently given in numbers, the classes dress, 'bout face, form into general line, enter the house, and file off to their respective rooms, where the several teachers are at their desks to receive each his or her class. The classes file into the class-rooms, moving in regular succession to their seats, where all remain standing until the order is given to be seated. In this manner the entire school of 900 scholars is brought into the house and seated in a very few minutes and without the least disorder, and with a stillness which is most remarkable. The same order is observed at noon and afternoon recess, also in leaving the rooms. The management of the boys in the yards, their arrangement and march to their class-rooms is under the especial direction of the two male Assistants, Messrs. Prior and Holbrook. This entire arrangement has been devised by Hoitt, the Principal, and is one of the most interesting features connected with the school. The same system has been adopted, to a greater or less extent, in most of the Common Schools in the city. The boys appear to enter into it with zest and interest, and its effect upon the general order and discipline of the school is most marked and beneficial.

Several of the teachers have introduced various pleasing and profitable exercises. Miss Fowler, of the Fifth Class, teaches Natural History in connection with the reading lessons, illustrated with drawings upon the blackboard. Some of the drawings executed by the pupils are of a character exceedingly creditable to even proficients in this interesting art. Such exercises are highly beneficial in training the minds of the pupils to a love of the beautiful and useful in nature.

Mr. Hoitt, the Principal, has recently introduced a system of monthly examinations (written) into the standing and progress of the classes, which promises to be productive of much good. This examination was in progress in some of the classes during our visit. It is intended, in part, to furnish the Principal with reliable data of the progress of the various classes which are placed under separate teachers. It has already created quite a marked and wholesome rivalry, among both teachers and pupils, in parallel grades.

By the politeness and attention of Mr. Hoitt, we were shown over the entire building, visiting each separate class, and making the acquaintance of all the teachers. The utmost order and attention are everywhere apparent. In some of the lower grade classes, especially, we were most particularly struck with this characteristic. It was not a constrained submission, brought about by fear; but each individual pupil evidently felt a personal interest, and took an active part in bringing about a common result. There was none of that apparent weariness or lassitude so often observed in schools. Bright and intelligent faces everywhere beamed with joy, giving evidence that they were deeply interested in their tasks. The teachers, both Principal and assistants, were all easy and familiar with their pupils; giving unmistakable evidence that their hearts as well as heads were in the work before them. It was no wonder that the Principal, in showing us about, expressed himself so freely in regard to the confidence he reposed in his assistants.

Miss Swain, Miss Hitchins, Miss Bunker and Miss Kimball, each gratified us with exhibitions of their respective classes in drill and calisthenics, accompanied with singing, humming and whistling. The boys went through their exercises with a spirit and *vim* which, when in the upper rooms, made the solid edifice tremble, almost as though it were being shaken with an earthquake. Such exercises cannot but be highly beneficial to the health and development of the pupils, while they add interest to, and give zest and variety to the ordinary routine of study.

While in Mr. Hoitt's room we were permitted to examine the Historical Register of the school, which is kept in a ponderous tome, where the names of all the children who enter the school are enrolled; and where the age, place of nativity, residence, time of entering and leaving the school, the occupation of their parents, and general standing as to character, studies, etc., of each pupil is put upon permanent record.

We spent the chief portion of the hours of our visit in Mr. Hoitt's room with the 1st class. Mrs. Hoitt appears to have the principal management of this class, the attention of Mr. Hoitt being so often called to other parts of the house, in looking after his extensive charge, that it would be utterly impossible for him to confine himself to any one class.

We would take this occasion to mention that Mr. H. is evidently a hard worker; and that his whole mind, both in and out of the school, appears to be devoted to his profession. The position of a teacher having from nine hundred to a thousand pupils under his charge is no ordinary one; especially when the duties of that position are faithfully performed. That the Principal of the Lincoln School comes fully up to the highest standard in his profession, no one capable of forming a correct judgment, will doubt, who will take the trouble to visit that school and spend the day there as we have done. Although two days would be quite short time enough to form anything like an intimate acquaintance with the institution yet we saw fully enough in one day to satisfy us that it was a model school. If we had the time to spare, we could spend a week profitably and pleasantly, in the various rooms. As we have already intimated, we had time to observe closely the exercises of the 1st class only. They were conducted chiefly by Mrs. Hoitt, and, while we were present, consisted of spelling, geography and grammar. The spelling was very prompt and correct. It was conducted both orally and in writing. The writing exercises serves the double purpose of instruction in both writing and spelling. There are many scholars who can spell well orally, who are very deficient when it comes to writing. The writing exercise, we consider decidedly the most practically useful. We are not advised as to whether it is generally adopted in the public schools in this city. At all events it should be. There is nothing that operates so much to the disadvantage of a business man, in his correspondence, as bad spelling. Indifferent penmanship and even inelegant composition is more readily overlooked than bad spelling. Haste and a general lack of literary taste in a business man will excuse the two former; but there is no excuse for the latter. Every boy and every girl should know how to spell correctly; and they should be accustomed in school to written exercises, in that primary and useful branch of education. Boys and girls remember this, and don't neglect your spelling lessons. It is a dry and uninteresting study; but if you neglect it when young, you will be sure to regret it when old; and a person in years can more easily attain almost any other branch of common school education than spelling.

The geography recitations of Mrs. Hoitt's class were very fair. The particular exercises while we were present related to the economical and historical departments of that branch of study—the productions, natural and artificial advantages, political organizations, and the rise and origin of the different nations, whose territories were under consideration. It appeared to be the aim of the teacher to see that the pupils had formed a correct and definite idea of the subject to which their attention was called, rather than to require a strict adherence to the text of the books which had been placed before them. To this end they were encouraged to give the facts called for in their own language. This practice is a good one. Recitation is a mere effort of the memory without calling to aid the judgment to understand or comprehend what is repeated. Information so obtained is of but little practical value, and is usually soon forgotten. The manner of teaching adopted by Mrs. Hoitt is well suited to both interest the mind of the pupil, and to fix in his memory the lessons to which his attention is directed.

We were particularly pleased with the analytical character of the grammar exercise. The facility with which the pupils, generally analysed sentences, was especially noticeable, and evinced a thorough understanding of the principles which they were called upon to apply. The requirement of original examples, not found in the text books, called into full exercise the capacity and imagination of the pupil. Indeed the whole course of instruction adopted at this school seems to tend, in the highest possible degree to the fullest development of the mental faculties of the pupils.

Biennial School Report.—We have received the Biennial Report for 1865–6, of Mr. Swett, the Superintendent of Public Instruction. It is a very interesting and comprehensive document, comprising a volume of over 400 pages. In addition to the usual statistical information, the volume contains a large amount of valuable and suggestive matter in relation to the Schools, and Education generally. It is also illustrated with views of a number of the most prominent educational establishments, both public and private, in various parts of the State.

The Great Suit against the Union Mine at Copperopolis.—The San Francisco correspondent of the *Territorial Enterprise* gives the following particulars with regard to the great suit now pending against the Union Copper Mine:

The Union Copper Mine is estimated to be worth eight or ten millions of dollars—more than the Gould & Curry was valued at in its palmiest days. But of course prosperity will always produce litigation for a mine, and a thirteenth of the Union is now in Court, as you are already aware. From what I can learn, there is more law than equity on the side of the parties who have brought the suit. This is the story: Mr. Reed came out here several years ago, leaving a wife and daughter in Massachusetts. His wife got a divorce from him during his absence, and was awarded custody of the child. When the Union mine was located, Reed, notwithstanding his wife's uncomplimentary conduct, put the names of herself and her daughter down for full claims (a thirteenth each), though, strictly speaking, he had no right, under the mining laws, to locate women, and especially absent ones, in a mine; but when these claims were likely to be jumped, he transferred them to male friends of his, who held them for him. The mine became valuable, and the late Mrs. Reed and daughter came out to California to look after it. At Mrs. Reed's request, the Court transferred the guardianship of the child to Mr. Reed, and then, also at her request, he sold their two shares, which were standing in the names of Reed's friends, for $20,000, to Messrs. Hardy & Meader, and gave the lady her $10,000, and so secured the daughter's $10,000 that it could be delivered to her when she should become of age. This was all very kind and very generous on the part of Mr. Reed, but the lawyers, in smelling around lately, discover the fact that the daughter's share was sold simply at the request of the mother, and that Reed had neglected to secure himself with the formality of an order of the probate court, which was necessary to render his sale of his ward's property legal and valid. So now the daughter sues her father (who still owns in the Union) for a full thirteenth of the great mine, and refuses to recognize the former sale. If the daughter wins the suit, her lawyers, Messrs. Clark & Carpenter, are to get one half. This is hard upon Reed, considering all his generosity. It ought to teach him never to be generous again to anybody.

MINING AND SCIENTIFIC PRESS

PATENT AGENCY.

For the Pacific Coast.

Office of the Mining and Scientific Press—No. 505 Clay street, corner of Sansome, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington.

The first question that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the Mining and Scientific Press. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, consulting with the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we conduct such investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, our Washington agent has access to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportioned to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimentions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: Dewey & Co., Mining and Scientific Press, No. 505 Clay Street, corner of Sansome, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the success of our application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make it special point to forward our cases as rapidly as possible.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance.

The following is the Government tariff of fees established by law:

On every application for a design, for 3 yrs and 6 mos	$10
On every application for a design, for seven years	15
On every application for a design, for fourteen years	30
On every application for a patent, for seventeen years	15
On every caveat	10
On issuing each original patent	20
On filing a disclaimer	10
On every application for re-issue	30
On every additional patent granted on a re-issue	30
On every application for an extension	50
On the grant of every extension	50
On appeals to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C.	25

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

N. B.—We make out our own forms for applications, etc., and would respectfully inform all parties that we have no printed blank forms for sale.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

Mr. Wm. R. Bradshaw, is our Special Correspondent and Traveling Agent. All favors or assistance rendered him in his progress through the country in behalf of our journal, will be duly acknowledged.

SAN FRANCISCO, Jan 1st, 1866.

Mr. A. C. Knox, is our fully authorized Traveling Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.

SAN FRANCISCO, Jan 11th, 1866.

Mr. Elwin Davis, is authorized to solicit subscriptions, advertising, etc., for the MINING AND SCIENTIFIC PRESS, in San Francisco, and to receipt for the same.

San Francisco:
Saturday Morning, Mar. 17, 1866.

Endorsement by the Miners' State Convention.

The following resolution was adopted by the California Miners' State Convention, held at Sacramento, Jan. 17th, 1866:

Resolved, That we regard a mining paper or journal of great importance to the mining interest of California, and we recommend the MINING AND SCIENTIFIC PRESS, of San Francisco, to the consideration and support of the miners of the Pacific coast.

PETROLEUM MATTERS.—We understand that the pump is now at regular work in the Lexington well; all the strata of oil rock which have been passed through by the well, have been opened, by cutting the tubing at the proper points to admit of the seepage of oil into the well. As soon as the lateral pressure from the column of water in the well upon the several oil stratas has been removed by the pump, we may expect to learn the full capacity of this well for producing oil. We learn that quite a considerable quantity of oil is even now being raised; sufficient to warrant quite flattering expectations in the minds of the shareholders. We trust their fullest anticipations may be realized.

The new retorts recently erected at the Petroleum works, six miles north of Santa Cruz, are working well, turning out over 100 gallons of crude oil per day. The refinery is only run three days in the week. There was a cave in the main body of the material a few days since, removing a mass of oil-sand of over 100 tons in weight, the richest yet worked; after the cave a large amount of gas escaped from the cracks and fissures. Since the late rains several new indications have been discovered, showing rich signs of petroleum. It is now confidently believed that a stream of flowing oil might be struck by boring deep enough, in the valley below the works.

The Wilmington *Journal* says: "The Los Angeles Pioneer Oil Company's well is 330 feet deep; it sends forth daily about 1,500 barrels of water, with five or six gallons of oil. Gas issues from it, resembling the noted burning springs of Western Virginia, sufficient to light several large hotels. Water was struck at the depth of 310 feet in shale rock, which continued for ten feet, when sandstone was again found."

THE RAIN FALL.—The rain fall in this city, from September 1st, 1865, to March 1st, 1866, has been 19.49 inches. The fall in Nevada for the same period was 39.92 inches. This is about the usual proportion of rain between the sea coast, at San Francisco, and the middle western slope of the Sierra Nevadas.

THE MINERAL LANDS IN CONGRESS.

The Senate Committee on Public Lands have decided to report adversely to Sherman's (Senate) Bill. Senator Stewart, of Nevada, has been selected to draw up the report. That report will doubtless be all that the strongest opponents of the sale of the mineral lands could desire. Four out of nine of the Committee on Public Lands in the House have reported in favor of Julian's (House) Bill, for the survey and sale of the mineral lands. McRuer, of California, who is one of the minority, will submit a minority report.

In some respects the bills of Sherman and Julian differ; but both provide for a radical change in the policy of the Government heretofore adopted in dealing with the mineral lands of the Pacific Sates and Territories. Julian's Bill is generally considered to be the least objectionable, being more simple in its provisions, and aiming directly at the single object of granting absolute titles to the possessors, and such as may subsequently become, under that hill, owners of mineral lands.

The mining interest has two powerful friends in Congress, who are watching with eagle eyes the attempt being made to force upon the country these two bills of abominations. When the proper time comes, Mr. Stewart of the Senate, and Mr. McRuer of the House, aided by the entire Pacific delegation, in both branches of Congress, will give them such a ventilation as will put a pretty effectual quietus on this and all other attempts of mere politicians to push through Congress, under the mistaken apprehension of doing a public good, a measure, the legitimate result of which would be the creation of a cloud of overshadowing monopolies, that would result in the absolute ruin of the mining prospects of the Pacific coast, and eventually end in financial disaster to Eastern commercial enterprise, and ruin to our national currency, by the closing up, to a great extent, of the present supply of precious metals, to which, more than to anything else, we must look for future commercial prosperity, and an early resumption of specie payments. It is useless to speak to Californians of the utter impossibility of carrying out the letter of the project proposed in both of the bills now under discussion. The bills are as impracticable as they are impolitic. By the time this discussion is over with, in Congress, the wants and condition of the miners and our mineral interests will be better understood than they have ever been heretofore.

The feeling in behalf of a wise and liberal policy on the part of the Government, in this matter, is rapidly gaining ground, in both branches of Congress, and we may feel confident in the assurance that no bill for the sale of the mineral lands can possibly become a law during the present session of Congress. But, as "eternal vigilance is the price of liberty," our citizens have wisely determined to let our delegation in Congress know that we are not indifferent to the perils by which we are surrounded, and at the same time lend a helping hand to those who are doing valiant service for us in the halls of the National Legislature. Accordingly, a

PUBLIC MEETING

Of all persons interested in mines and mining was held on Thursday afternoon last at the Merchant's Exchange, in this city, for the purpose of considering and taking action in this matter. Among those present were Alpheus Bull, President of the Savage and Gould & Curry mines; Solomon Hydenfeldt, C. P. Lolor, W. H. V. Cronise, R. G. Sneath, Mr. Wand, E. B. Holmes, and others. Mr. Sneath was called to the chair, and Mr. Holmes appointed Secretary. After a general and informal interchange of opinion it was decided to appoint a committee to draft resolutions expressive of the sentiments of the people of the Pacific coast, touching the subject of the disposal of the mineral lands by Government—Committee to report at an adjourned meeting to be held on Tuesday afternoon of next week. Messrs. Bull, Cronise and Hydenfeldt were appointed a Committee with power to add nine other gentlemen, making the Committee to consist of twelve members. The meeting adjourned.

We trust there will be a full attendance of those interested at the next meeting, to show that we are on the alert, and see that no advantage is lost by any appearance of supineness on the part of those most interested. Emphatic action at the present time will greatly encourage our friends in Congress and exert an important influence on many who have hitherto favored a sale of the mineral lands, through a mistaken apprehension of what was for the public good.

GAS IN A QUARTZ MINE.

Some weeks since, we made a brief notice of an irruption of noxious gas into the Leviathan tunnel, near Monitor, Alpine county, and in such quantity as to drive the workmen from the tunnel. The *Gazette* of the 9th instant contains the following item of further information with regard to the phenomenon:

It was thought the unwholsome and offensive gas which prevented work in the Leviethan tunnel would be obviated by the introduction of pipe and the use of a fire-blast, but we are sorry to say the experiment was tried last week and proved unsuccessful. The workmen found improvement sufficient to enable them to breathe comparatively well, and pushed the tunnel ahead several feet, but were compelled to abandon the undertaking by reason of the destructive effect on the eyes. The use of a large bellows in place of the blast was also tried, but still the eyes were pained beyond endurance.

Query.—What is the cause? and what the remedy?

The gas usually encountered in mines is sulphureted hydrogen, a highly inflammable substance. Carbonic acid gas is sometimes met with, in which neither flame nor life can exist. It is very seldom that either of these gases are met with in any other than coal mines, where the former, especially, is very often encountered, and is produced from the decomposition of organic substances. As it is seldom that organic substances are met with in mines of silver or gold, we must attribute the formation of such gases there to other causes than the decay of vegetable matter.

In the case above alluded to, the gas encountered was probably a sulphureted hydrogen, produced by the decomposition of iron pyrites and water. It was, perhaps, mixed with a small quantity of sulphurous acid gas, which latter, if present in any considerable quantity, would cause a smarting sensation in the eyes and a tingling in the throat, provoking a hacking cough. The smell of sulphureted hydrogen is exceedingly nauseating and oppressive, as described by the *Gazette*. It is more than probable that on reaching a greater depth, or near to the point at which this chemical action is taking place, hot water will be encountered, as in the Ophir mine, about a year ago. Had that mine not been thoroughly ventilated, the workmen there would doubtless have observed the presence of the same kind of gas as that met with in the Leviathan tunnel. The only way to get rid of it is to arrange for a thorough ventilation of the tunnel.

MINERS AND ASSAYERS in want of assayers' material will do well to call upon John Taylor & Co., of this city, importers and dealers in such material. That firm keeps constantly on hand a large assortment of balances, furnaces, crucibles, gold scales, chemical glassware of every description, etc. See their advertisment in another column.

YUBA GAP WAGON ROAD.—According to the returns, as published in the Downieville *Messenger*, the proposition to aid the Yuba Gap Wagon Road, by scrip from that county, has been defeated by a small majority.

THE SILVER PEAK MINES, which were discovered only about one year since, have already yielded over $100,000 of bullion. A shipment of 1,200 pounds of bullion was lately received in this city, at one time.

A PEARL, valued at five thousand dollars, was recently shown the editor of the Panama *Star and Herald*, taken from the Pearl Islands in the Bay of Panama.

[Written for the Mining and Scientific Press.]

From Sacramento and Placer Counties.

BY OUR TRAVELING CORRESPONDENT.

MESSRS. EDITORS:—As it is raining to-day, and disagreeable traveling, I will while away an hour in writing up my notes from Folsom to this place. The first point reached, of any interest, was Mormon Island, one of the oldest mining camps in California—the second one discovered, I believe—which continued for a time to pour its streams of golden treasure into the City of the Saints, from whom it derived its name. The Island proper was a rich bed of gravel, in the midst of the South Fork of the American River, now nearly worked out and given over to Chinamen.

Very little is being done in the way of mining immediately in the village, although the impressions prevail that there are very rich deposits of gold near at hand, requiring capital and enterprise to bring them out, and there is a long and hopeful future to the place, when they shall have driven their tunnels in all directions into the hillsides around, giving employment for labor and capital for at least a generation.

The Natoma Ditch Company, with a capital of $300,000, have purchased twenty-eight claims of 30 feet front and 100 deep, in Blue Ravine, just above the village, in Red Bank District. They have a tunnel, saying nothing of its branches from either side, full 2,500 feet in length, costing in round numbers about $30,000, which they expect to extend the ensuing year 1,700 feet farther, through which a very large portion of what is believed to be valuable ground, will be reached. This ravine has paid heretofore $7 or $8 to the hand, and it is the belief of the Agent of the Company here, that it will pay well throughout its whole extent, perhaps on an average of $6 to the man.

Many in the neighborhood have abandoned mining, and are now engaged in extracting the precious metals from the soil, in the form of fruit and wine, large quantities, and of first-rate quality, being produced from year to year. Mr. Bughee informed me that his vineyard turned out last season 8,000 gallons of wine, worth $1.50 per gallon. Pardon me for this digression, for I was nearly as much *excited* by the wine of this locality, and felt myself nearly as rich, as if I had just discovered another Ophir. In the vicinity of the Rowland Hill House Messrs. Eels & Co. were found, sinking a shaft in search of copper, good indications of which are seen for miles both north and south of where they are at work. A large amount of prospecting has been done to discover good copper ore in this region, but thus far without satisfactory results, and all, with the above exception, have ceased work. While these gentlemen have much to encourage them, their perseverance deserves a rich reward. Success to them!

As to this place, I see little to hope for in the way of mining, unless good quartz lodes should be discovered, for surface diggings are becoming more and more unprofitable. I give first impressions. Should anything be seen or learned during my stay here to alter my views, you shall hear from me again. In the meantime, I remain, as ever, your faithful

PROSPECTOR.

Salmon Falls, March 8th, 1866.

MOORE'S GRINDERS.—The following is an extract of a letter from F. O. Nelson, Superintendent of the Victor Gold Mine Company, at Rocky Bar, Idaho Territory, under date February 14th, 1866. The grinder and amalgamator referred to is that patented by Mr. Albert Moore, of this city. Mr. Nelson writes of this machine as follows:—

"Your grinders and amalgamators work finely, and are all that one could wish them to be. With five stamps and two grinders I crush and amalgamate twenty to twenty-five tons per day, (twenty-four hours). Col. Ruckle told me that he should order some of them for his mill on Powder River. [The colonel has since handed in his order to Mr. Moore.—EDS. PRESS.] Also Mr. W. Waddingham, Superintendent of the Waddingham Mining Company, at this place, will want them. [Mr. Waddingham's order for two of the machines was received some time since. They were promptly forwarded, but are now snow-bound on Blue Mountain, *en route* for the mill.—EDS. PRESS.] There are others who will order these grinders this spring. Parties in New York are writing me, and want to know how I like Moore's Grinders, and my answer to them is, that they are the best grinder and amalgamator in use, and I think, ere long, you will sell a great many for this territory, as well as Montana.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, March 17, 1866.

Money continues abundant, and there is no difficulty in negotiating anything ordinarily acceptable in Bank. The demand upon Mining Stock collaterals is active, and certain shares are in more favor with capitalists than for months past, as a basis for loans on short time. Rates of interest still rule at 1@1¼ ₱ cent. per month in Bank, and at 1¼@1½ for outside transactions.

The business of the Board during the week has been much heavier than usual. Some leading stocks have improved, and are firmly held at the advance, while others were exceedingly buoyant at fluctuating rates, and closed with less strength than at the date of our last report. A number of claims are now yielding largely, and their present condition is such as to insure the belief that they are not likely to become less productive for some time to come. One Company has declared its first dividend; several are out of debt, with a reserve on hand, and others are preparing to accumulate a fund for stockholders. More economy, and better judgment now seems to be used in the administration of the affairs of these Companies, and the good results of such a policy will soon be apparent in increased profits. A number of low-priced Stocks have been active this week, and formed quite a feature of the daily transactions.

Crown Point has met with small sales; opening at $1,350, receding to $1,290, rallying to $1,300, then selling at $1,175—ex dividend of $50 per foot—and closing yesterday at $1,150 bid. After the payment of a dividend for the month of February, a surplus of $15,000 was carried forward out of the net earnings for that period. Since the 1st instant, the receipts of Bullion have exceeded $40,000, and during the week ending the 9th, 700 tons of ore were extracted from the mine. In running south, 23 feet from the north line on the lower level, an improvement has taken place, and the incline from that level now down 27 feet (60 feet from the north line), is also looking well. In drifting into the extreme west deposit at a depth of 300 feet, it is said that ore worth some $40 per ton has been disclosed. Some 25 tons of first-class ores have been delivered to the Central Mill recently.

Savage was dealt in to the extent of 150 feet, rising from $1,050 to $1,100, receding to $1,015, rallying to $1,020, then selling at $960, and closing at $990. This mine is now producing an average of 70 tons per day, chiefly from the upper levels. It is said that the old or main working shaft will be connected with the drift from the bottom of the winze in the sixth level, on or about the 1st of April, and then be ready for the extraction of ores at that depth. In the openings already made on the sixth station, a body of ore 20 feet wide and 90 feet in length, has been developed without having reached its limits. Receipts of Bullion during the first half of this month, amounted to some $70,000, and the Company are now said to be out of debt, excluding the monthly intallments due upon the Minnesota Mill. The average yield of 2,400 tons of second-class ore last month, was $50.22 per ton, and 100 tons first-class ore produced $300 per ton.

Hale & Norcross rose from $1,050 to $1,150, receded to $1,010, then sold at $1,090, and was dealt in yesterday at $1,000. The ore product of the mine this month will probably amount to 2,000 tons, worth $40 to $45 per ton. The aggregate yield of Bullion last month exceeded $49,000, and since the 1st instant the receipts have amounted to $23,000.

Gould & Curry has been dull and inactive, and trifling sales were made at $1,050, seller 15, closing at $975 bid. The only recent change to note has been the tapping of a considerable body of water in the north branch drift from the second station, which is supposed to indicate the close proximity of a large seam of quartz. Receipts of Bullion from the 1st to 9th instant, inclusive, amounted to $72,500.

Yellow Jacket has attracted considerable attention, and 385 feet were sold; suddenly advancing from $550 to $700, dropping to $640, rallying to $680, receding to $525, seller 30, advancing to $600, declining to $575, then selling at $755—assessment of $150 delinquent, and changing hands on Friday at $690@$695. The receipts of this Company were as follows for the month of February: From 3,056 tons of ores crushed, $84,210 88; ores sold, $906.07; Morgan Mill credit balance, $11,426 10; other sources, $1,568 14: total, $98,-311 19. The following disbursements were made: For labor account and supplies, 21,274 15; No. 2 South Hoisting Works, $12,-668 59; Legal expenses, Real Estate, etc., $3,294 44; crushing and hauling ores, $45,913 83; other expenses, $14,476 14: total, $98,-627 15. The indebtedness of the Company January 31st, was $175,-622 91, and on the 28th of February, it amounted to $175,938 87. Of the 2,377 tons of ore worked at the Company's Mills during the month of February, 2,032 tons were treated at the Morgan Mill—1,302 tons second-class averaging $32.35, and 730 tons third-class yielding $15 per ton. The Illinois Mill crushed 345 tons, producing $29.13 per ton. The west drift from the south shaft has now reached a promising body of ore, the porphyritic formation having disappeared. This deposit is thought to be identical with the west stratum of the Crown Point Company.

Ophir has been exceedingly active, and 483 feet were dealt in, receding from $760 to $640, rallying to $700, declining to $600, again rallying to $700, dropping to $650, and selling yesterday at $620@$635. The north end of the newly-discovered deposit in the ninth gallery of the South Mine, is said to look favorable for a large body. The ore found on the east side of the vein assays $150@$180 per ton, and the west portion from $39 to $85. Drifting west has been suspended for the present, but work will be continued north and south on the lode. Some 700 tons of ore have already been hoisted to the surface from that locality—an average of some 60 tons per day for the past two weeks. The total indebtedness of the Company at this time is about $70,000.

Chollar-Potosi has been well maintained, advancing from $390 to $410, buyer 30, receeding to 395, then selling at $392@385, and closing yesterday at $390. During the week ending March 9th, 905¾ tons of ore were sent to custom mills. The Grass Valley Station has improved recently, and is now producing from 8 to 10 tons of ore daily. The Bajazette ground shows considerable deterioration, and is thought to be nearly worked out. Stope over head of Incline is looking very well, from which 50@60 tons per day are taken. There is no change in the old works of the Chollar.

Belcher is in rather better favor, and some 200 feet were ready, advancing from $295 to $390, receding to $290, and selling yesterday at $270. Alpha met with small sales at $310@300, closing at $290 bid.

Empire Mill and Mining company dropped from $235 to 200, rose to $240, declined to $202½, advanced to $215, then sold at $214, and closed at about $214. The recent fire in the drift, from the 1st or 245-feet Station, did but slight damage to the shaft, and the necessary repairs will soon be made—meanwhile (as for some time past), ores will be hoisted through the Eclipse Shaft. Both the company's mills are running up to full time.

Imperial rose from $170 to $180, buyer 30, receded to $159, then sold at $157½@143. During the quarter ending February 28th, 9,796 tons of ore were reduced, producing $231,211.38 ($23.61 per ton); and the receipts from other sources, including premium on bullion bills discounted, amounted to $8,786.78, making an aggregate of $239,-998.16. The company's disbursements for the same period were as follows: Milling expenses, $76,567.50; Mining do., $40,659.31; Over drafts, $13,764.66; Fedoral, State, and County Tax, $14,070.95; New Shaft, $8,599.75; Properly purchased and interest paid, $1,762.50; Bills payable, $51,000; Cash and credits in favor of company, $33,-573.49—total. $239,998.16. Their debt at the close of the quarter amounted to $4,000, maturing March 28th, which left an actual surplus of $29,573.49. The first "clean-up" this month is lighter than usual, and amounted to less than $9.000.

The aggregate recorded sales of Stocks, since Saturday last, amounted to $1,221,762 50.

By city carriers, per month	50
Single copies	12½
Monthly Series (or parts), containing 4 Nos	50
Monthly Series, containing 5 Nos	62½

THE CIRCULATION of the PRESS, already extensive, is rapidly increasing, and substantial men who can profit by widely disseminating information of their business amongst the most intelligent, influential and industrial classes of the Pacific States and Territories will find no more effectual or economical medium for advertising

DEWEY & CO., Proprietors.

Patent Agency and Job Printing Office, 509 Clay street, San Francisco. July 1 1865

There is a vast bed of coal underlying the city of La Salle, Iowa. The city fathers propose to sell the right of mining coal under the city (which lies at the depth of 300 or 400 feet below the surface) to the highest bidder, and expect to get a bonus of royalty of twenty cents per ton for the privilege. It is estimated that there are 27,000 tons under each acre.

It is proposed to introduce in the Paris Exhibition of 1867 a number of workmen of all nations, who will be employed in manufacturing the articles which are in common use in their respective countries.

RUGGLES' PRINTING PRESS

For Sale or Exchange.

The Proprietors of the Mining and Scientific Press have on hand a Half-Medium Ruggles Engine Job Press, in condition good as new, which will be sold cheap, or exchanged for a good Hand-Press of medium or large size.

Our Patent Agency.

The Patent Agency of the Mining and Scientific Press has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of Letters Patent from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

To Mining Companies.

A GENTLEMAN OF MUCH EXPERIENCE AS A MINING Superintendent, in England, Spain, and on the Pacific coast, and one intimately acquainted with every department of mining, and with nearly every class of mineral, is desirous of securing a position as Superintendent of some mining operation in California or Nevada. The applicant was for four years Superintendent of the New Almaden Quicksilver Mine, in this State. The best of reference given on application at this office.
San Francisco, Oct. 12, 1865 .5v11tf

REMOVAL.

Informs his patrons that he has removed his DRAWING SCHOOL from Pine street to
410 Kearny Street.
Drawing Classes in the Evening will take place as usual. DRAWINGS FOR PATENTS accurately and neatly done. 20v11-1m

Volume Twelfth.—The Mining and Scientific Press, with its last issue, commenced its twelfth volume. Since Dewey & Co. have "held the ribbons" its gait has been rapid toward a perfect journal. Its appearance evidences its prosperity, but doubtless, like some of the rest of us, it can stand increased encouragement. Let such be given, and, our word for it, volume thirteen will acknowledge receipt.—[Golden Era.

Metallurgy.

MOSHEIMER'S CONCENTRATOR
RECEIVED THE FIRST PREMIUM
From the ROYAL POLYTECHNIC SOCIETY, in Cornwall, and was highly recommended by the Commissioners as the most Simple and Effective Concentrator for all kinds of Ores.
Every Quartz Mill ought to have them, as they not only save Gold and Silver, but also the Quicksilver and Sulphurets, without extra labor. They can be built entirely of wood at the mine, and will separate more perfectly in one operation, than any other Concentrator in use. Apply to
J. MOSHEIMER,
23v11qy 423 Washington street.

EUROPEAN
METALLURGICAL WORKS,
—AND—
Practical Mining School,
Bryant Street, Between Third and Fourth,
SAN FRANCISCO.
THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.
PRACTICAL MINING SCHOOL.
The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.
S. P. Kimball, J. R. Murphy.

By Mail.—The Mining and Scientific Press will be sent by mail to any part of the civilized world. In case of removal, subscribers have only to inform us of the post-office address of their old and new location, and the paper will be sent accordingly.

Send us Word.—If any subscriber to this journal fails to receive the same regularly and promptly, they will confer a favor by informing us at once.

WE STAND CORRECTED.—A correspondent of the Nye County *News*, writing to that paper from Weston, Nye county, under date of February 27th, says:

I notice frequent mention in the MINING AND SCIENTIFIC PRESS, and other papers, under the head of "Outside Districts," which I inter implies everything not centered at Austin or Virginia City. Not wishing to detract from the rich mines at either place, I would ask, have we not an independent existence? It must be exceedingly gratifying to the miners of Union and Mammoth Districts to be so classed. The owners of such mines as the Murphy, at Twin River, the Dee, at San Antonio, the Live Oak, Vigilante, Keystone, Uncle Sam, Rough Diamond, and others, in this district, and the many fine mines at Ione, must be highly elated to be connected with Austin as "outsiders." Admitting that the obnoxious phrase originated at Virginia, not without reason, let it be known that it is not applicable here, in a vast region of country being developed with double the energy, in all save building mills, perhaps, in advance of a supply of ore. Of course, that excellent and valuable journal, the MINING AND SCIENTIFIC PRESS, means no unkindness; on the contrary, it is the impartial advocate of mining industry everywhere, but it is the limited knowledge of the great extent of the silver region of Central Nevada, of the vigorous earnestness of the bone and muscle struggling here, as yet unassisted by greenbacks, which have built up the magnificent mills at Austin, and of the number of prosperous mining districts, many equal, many superior to the "great centers." For Mammoth I will say, we are "outside" to no place, nor are we second to any, and this we will prove at the earliest possible day. Everybody notice, and drop the odious term, as applied to us.

A CURIOUS LANDSCAPE.—There has seldom been a greater instance of misplaced ingenuity than the great landscape in mosaic made by a clerk in the French War Office. It is composed entirely of insects (of beetles alone there are more than forty-five thousand) of nearly four thousand species, and took four years in making.

THERE were eighty-seven persons struck and killed by lightning in France during the year 1864, of whom sixty-one were men and twenty-six women.

A Business Compliment.

PETALUMA, Oct. 4, 1865.

MESSRS. DEWEY & CO.—Gentlemen: Your note informing me that my patent for Crushing and Baling Machine is ordered to issue is at hand. Please accept my thanks for the prompt and business like manner with which the case has been conducted, and inclosed find twenty dollars for balance Government fees. Respectfully, etc.

JACOB PRICE.

1852. 1866

A NEW VOLUME.

Fourteenth Year of Publication.

THE GOLDEN ERA.

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire Gold of its great and rapidly increasing circulation, The Golden Era is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents and contributors of distinguished ability in New York, Paris and London.

Miss BRADDON'S Greatest Sensation Story published from Advance Sheets:

RUPERT GODWIN;

—OR—

The Secret of Wilmindon Hall.

A NOVEL.

By Miss M. E. Braddon,

Author of "Lady Audley's Secret," "The Outcasts," "The Doctor's Wife," "Three Times Dead," etc.,

—IN—

THE GOLDEN ERA.

NOW IS THE TIME TO SUBSCRIBE!

The Golden Era is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render The Golden Era a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome The Golden Era as a regular weekly visitor.

Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the Golden Era, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the contributors to the Golden Era are all the prominent writers of Literary Reputa in California and on the Pacific Coast, also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

"THOUGHTS AND THINGS"

APPEAR WEEKLY IN THE GOLDEN ERA.

Read "Thoughts and Things" in the Golden Era.
" Professor Clearquill." in the Golden Era.
" Dogberry," in the Golden Era.
" Alice Mason," in the Golden Era.
" Hugh Humphrey," in the Golden Era.
" Bill Dadd," in the Golden Era.

TO ADVERTISERS.

Best Advertising Medium.—The Golden Era is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village and mining and agricultural precinct in California, and offers unusual and unequalled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

ANNUAL REPORT
—OF THE—
Pacific Insurance Company.

In compliance with the act of the Legislature of the State of California, entitled "An Act concerning Corporations," passed April 22, 1850, the Pacific Insurance Company of San Francisco makes the following Annual Report:

I.—The amount of the Capital Stock of this Company is SEVEN HUNDRED AND FIFTY THOUSAND DOLLARS, and paid in GOLD.....$750,000

II.—The amount of the Assets is ONE MILLION AND FIFTY-ONE THOUSAND, FOUR HUNDRED AND TWENTY DOLLARS AND THIRTY-SEVEN CENTS..$1,051,420.37

III.—The Company has NO DEBTS.

IV.—The amount of insurance effected during the year, and which remained in force December 31, 1865:
Fire.....$12,973,949
Marine..... 484,408

This Company commenced underwriting Marine Risks, August 1, 1865:

V.—This Company insures against the following risks, viz.: BUILDINGS, HOUSEHOLD FURNITURE, MERCHANDISE, RENTS, LEASEHOLDS, VESSELS IN PORT AND THEIR CARGOES, and other PERSONAL PROPERTY, AGAINST LOSS OR DAMAGE BY FIRE.

Also, on CARGOES, TREASURE, COMMISSIONS, PROFITS, and WAR RISKS, and ON ALL MARINE AND INLAND NAVIGATION RISKS, TO AND FROM ALL PORTS IN THE WORLD.

VI.—This Company will take on any FIRST-CLASS RISK not to exceed $75,000 (the limit fixed by law), and on all large risks will reinsure to an extent consistent with PRUDENCE in other RESPONSIBLE COMPANIES.

Beard & Seaver Gold and Silver Mining Company, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 14th day of March, 1866, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately, to the Secretary, 402 Front street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 14th day of April, 1866, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Tuesday, the 1st day of May, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

N. C. FASSETT, Secretary.
Office, 402 Front street, San Francisco mar17

Blue Ledge Gold and Silver Quartz Mining Company, Kelsey District, El Dorado County, California. Office, No. 10 Government House, corner of Sansome and Washington streets, San Francisco.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 14th day of March, 1866, an assessment of one dollar ($1.50) and fifty cents per share on each and every share of the capital stock of the Blue Ledge Gold and Silver Quartz Mining Company, was levied, payable immediately, in United States gold coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Saturday, the 14th day of April, 1866, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 28th day of April, 1866, at 12 o'clock M. of that day, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

mar17 J. M. BUFFINGTON, Secretary.

Hurker Gold and Silver Mining Company, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 14th day of March, 1866, an assessment of fifty (50) cents per share was levied upon the capital stock of said company, payable immediately, to the Secretary, 402 Front street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 14th day of April, 1866, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Tuesday, the 1st day of May, 1866, to pay said delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

N. C. FASSETT, Secretary.
Office, 402 Front street, San Francisco. mar17

Economy in Advertising.—The Mining and Scientific Press is the best and most economical mining advertising medium in this city. Our terms are less than one half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

Jefferson Gold and Silver Mining Company, Lander county, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 14th day of March, 1866, an assessment of fifty cents (50) per share was levied upon the capital stock of said Company, payable immediately, to the Secretary, 402 Front street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 14th day of April, 1866, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 30th day of April, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

N. C. FASSETT, Secretary.
Office, 402 Front street, San Francisco. mar17

Keokuk Gold, Silver and Copper Mining Company, Clayton District, Contra Costa County, Cal.

Office, 402 Front street, San Francisco. mar17

Our Circulation.—The Mining and Scientific Press has a large and permanent subscription list, and enjoys a more universal circulation among stockholders and persons directly interested in mining than any other paper on this coast.

It is filled with reliable, useful and interesting matter, and to our miners who wish to understand the theoretical, as well as the practical part of their business, the Mining Press will be found an invaluable aid.—[Nye County News

Pride of the East Gold and Silver Mining Company, Lander County, Nevada.

By order of the Board of Trustees.

P. R. RINGSTROM, Secretary.

Office, 210 Pine street, up stairs, San Francisco. mar 3

THE DIAMOND HUNT AT OWYHEE.—The Owyhee *Avalanche*, speaking of the progress of the diamond excitement in that vicinity, says:

From recent remarks we have heard, confidential confahs seen among owners of claims, letters received from San Francisco, and a sudden stampede for the district, we do not think we can err much in saying that the recent diamond *furore* is proving a magnificent reality. In truth, the actual existence of diamonds in our country has at no time heen douhted hy our hest informed citizens who gave the suhject careful attention. Many men delight in crying down the new discovery; some scout it hecause they have neither the intelligence nor energy to ascertain truth, and wish to assume a species of prominence. Diamonds, especially in their crude state, would not he picked up in the street hy one man in a hnndred—more likely one in a thousand. How ahsurd and stultifying to pronounce a discovery a humhug without heing ahle to give a sensihle reason therefor. A great auxiliary to success in husiness is secrecy, and the more vital or valuable the ohject sought the greater the secrecy. It is for this reason we believe the present agitation to he founded on anthoritative knowledge. A gentleman who has given the suhject studious attention informs us that diamonds of the first water have heen found during the recent excitement, and that not a reasonable douht exists as to their plentifulness. It has been our aim to represent facts not fancy, and accordingly have kept our eyes and ears open, and have thus become convinced that Owyhee county is rich in diamonds. Without these, we have the richest known mineral region in the United States, and it would he folly to get up false impressions when the merit our camp possesses is almost excessive.

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three month's delay requisite in transacting business through Eastern agencies.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

J. B. CONE, BUSINESS AGENCY.—Makes private sales of Property and Business Places of every description, in the city and throughout the State; procures partners with large and small amounts of money; negotiates sales o mining property, and does a General Agency Business. Patronage solicited by mail, express, or by personal application at the office, 402 Montgomery Street, San Francisco, California. 23v11tf

FOR SALE.

Owing to the great distauce from our point of manufacture, we offer for sale the State Right of California for our

Patent Boring Tools for Artesian Wells,

Illustrated upon the first page of this paper February 17th. These Tools are now in use in the various Oil Regions of Pennsylvania, Ohio and Virginia; and although but just introduced, are universally approved and admired, and bid fair to become eventually the most popular tools in use. We shall close without reserve to the party sending us the highest bid, to whom we will mail a complete set of Drawings, copy of Circulars, etc.

Address, fully,

A. A. WILSON,
Morgan Iron Works,

7v12tf Foot 9th street, East River, New York City.

536 Clay Street. PAPER WAREHOUSE AND Printers' Materials. CHAS. F. ROBBINS & CO. 538 Clay Street.

GEORGE E. BROWN,

(Late Assistant Examiner in the U. S. Patent Office,)

HAVING RESIGNED THAT POSITION AFTER A TENure of office of eighteen months, offers his services to

INVENTORS AND THEIR ASSIGNEES,

—AS A—

Patent Solicitor,

He will make Preliminary Examinations in the Patent Office, with a view to ascertain the Patentability of any invention that may be submitted to him for that purpose; will prepare the necessary papers for those who wish to make Applications for

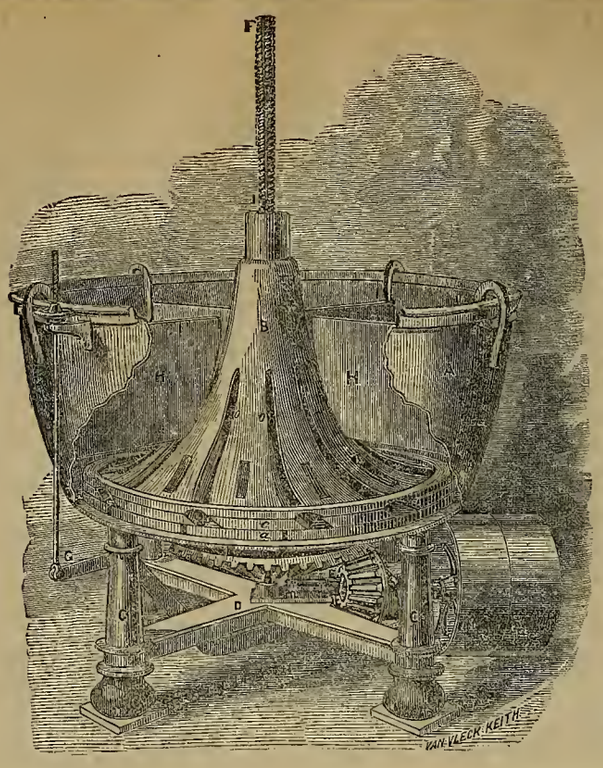
Patents for their Inventions,

—OR FOR—

EXTENSIONS OR REISSUES OF PATENTS

Already granted; will act as an Attorney in presenting Applications at the Patent Office, and in managing them to a final issue; will draw up Assignments; will examine into the condition of Rejected Applications when desired to do so, and undertake the prosecution of such as may be considered patentable, and do whatever else is usually done by Patent Solicitors.

Address, P. O. Box 257, Washington, D.C. 7v12-3m



THE EXCELSIOR
GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and o, Openings,

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers heing of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hnndred and seventy-seven tons of ore, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to he amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its hecoming coated with any foreign substances, after having heen hurnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to auy other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,
WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Family Chartres Coffee,

AND SPICES OF ALL KINDS,

No. 707 Sansome street, cor. Cold, bet. Jackson & Pacific.

First Premium Awarded

BY THE MECHANICS' INSTITUTE,

FOR BEST COFFEE AND SPICES.

The proprietor having introduced steam power in his Manufactory, has now increased facilities to supply the trade and the public in general. All articles from his establishment are guaranteed to be pure and unadulterated. The public are respectfully invited to call and convince themselves. Country orders promptly attended to. 16v11-3m

WE ARE NOW OFFERING

OUR IMMENSE STOCK

—OF—

Fine Custom Made Clothing

—AND—

Gents' Furnishing Goods

AT PRICES THAT DEFY COMPETITION.

Our Stock of Clothing Consists of

ALL THE LATEST STYLES

BOTH OF MATERIAL AND FINISH.

A Large Assortment of

Trunks, Valises, Carpet Bags, Blankets, Etc.,

AT EXTREMELY LOW PRICES.

J. R. MEAD & CO.,

8v10 Cor. of Washington and Sansome streets.

THE PRESS is a large, sixteen-page paper, and is truly a valuable assistant to the mining interests of the Pacific Coast.—[Nye County News.

THE NEW METAL THALLIUM.—This new metal, which was discovered by William Crookes, of London, has lately been described by the discoverer in the *Chemical News*, and preparations of it have been placed in the Great Exhibition. Thallium in most of its physical properties, resembles lead. It is not so white as silver, but when freshly cut, it presents a brilliant metallic luster. It is soft, malleable, and easily cut with a knife, and it marks paper when rubbed upon it, leaving a yellowish streak. It has a great tendency to crystalize, and ingots of it crackle like those of tin when bent. To flame it communicates a deep green color, and in the spectrum, according to the researches of M. M. Bunson and Kirchoff, its single green ray is as sharply defined as the yellow ray of sodium. Thallium rapidly tarnishes in the open air, and it becomes covered with a thin pellicle of oxide, like the oxide of tin—preserving the rest of the metal from oxidation. Its oxide is soluble, alkaline in its nature, and it has a taste and smell similar to potash. Sulphuric and nitric acids dissolve it under heat, and it burns in chlorine gas heated to 200°. It exists in many of the pyrites that are used in the manufacture of sulphuric acid.

TELEGRAPHS AND THE CHOLERA.—A. T. Hay, a veteran telegraph operator, says that during the period of cholera in 1849, and for several years, he was connected with the telegraph lines of the West, and during tho whole time he never knew of an operator dying, or even being attacked with the cholera.. The reason given is that in telegraph offices there is always the maximum of ozone, or highly electro-negative oxygen, combining with the non-ozonized oxygen, and thereby rendering the atmosphere pure. Ozone is destructive to malaria, and is highly beneficial to health in times of cholera or other malarial epidemics. There can be but little doubt but that the cholera will visit the United States during the coming summer, and then further observations can be made, and if telegraph offices are exempt from its ravages, they will become such popular institutions that everybody will have one.

BACK VOLUMES.

Back files of the MINING AND SCIENTIFIC PRESS, from January 1st, 1864, to the present time, will be furnished at $3 per volume of six months; bound in cloth, $5

A Good Financial Weekly.

The Stockholder:

MONITOR OF FINANCE AND INDUSTRY,

Is published every Tuesday Morning,

At 72 William street, New York,

—GIVING—

Quotations of all important Bonds and Stock Securities in the United States; GOVERNMENT, STATE, CITY, BANK, INSURANCE, PETROLEUM, MINING, and other miscellaneous Joint-Stock Organizations, with the Financial Statements of the same; Notices of Payment of Interest and Dividends—

fact, all matters that can be of interest to Security-holders.

Its columns will be found replete with important and useful financial information.

The Quotations given are correct, and may be relied upon either for the purchase or sale of Bonds or Stocks.

THE STOCKHOLDER is the *only strictly financial paper published in the United States.*

TERMS, FIVE DOLLARS PER YEAR.

All letters should be addressed,

GEO. M. NEWTON, Publisher,

Machinery.

HUNTER'S

PREMIUM

CONCENTRATOR, AMALGAMATOR

AND SEPARATOR,

Awarded a Silver Medal at the late Mechanics' Fair.

HUNTER'S CONCENTRATOR CAN BE SEEN IN OPERATION daily at the Novelty Iron Works, Fremont street. Parties wishing to purchase Concentrators will find it to their advantage to examine the above machine before purchasing elsewhere, for the following reasons:

1st. It will work the sands from a 5-stamp battery, and save from 10 to 20 per cent. more sulphurets than any machine built on the Pacific coast.

2d. The Sulphurets are washed clean, containing less than ten per cent. of sand.

3d. The waste free gold and amalgam is amalgamated on the copper plates; no trace of ground mercury and scarcely a trace of metal passed off with the sand.

4th. Its simplicity is a sufficient recommendation for its general use as a Concentrator. The variation of speed in a Quartz Mill does not effect the working of the Machine. The same was demonstrated at the late Mechanics' Fair, when with the greatest IRREGULARITY OF SPEED the best of results were given.

5th. There is no clogging or stopping to clean out the sulphurets and sand; consequently no waste from any inattention on the part of the attendant.

6th. In exhibiting the working of the machine (it is not run empty), all classes of ores and tailings, from 50 pounds and upwards, are concentrated that parties may see fit to test the machine with.

Give it a trial, and satisfaction is guaranteed All orders and any information required, address,

ANDREW HUNTER,

Novelty Iron Works, Fremont st., San Francisco,
15v11-3m Or to E. T. STEEN, Agent.

BAUX & GUIOD'S

Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts conveniently for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continually; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crail's Gravel Cement Works, Nevada county; Waltman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Heugh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6df

BLAKE'S

QUARTZ BREAKER

Is now extensively used for breaking hard masses of

Quartz or Ores

To a size suitable for stamps. These machines are patented, and are in practical operation in

CALIFORNIA, AUSTRALIA,
WASHOE,
ENGLAND, FRANCE,
—AND—
THE ATLANTIC STATES.

These Machines, or circulars containing further information regarding them, may be obtained of the undersigned. Address,

BLAKE & TYLER,

Box 2077 San Francisco Post Office.

CHAS. T. BLAKE, Idaho City. E. TYLER, Michigan Bluff. WM. P. BLAKE, San Francisco.
4v10

Hepburn & Peterson's

AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, Bryant St. bet. 3d and 4th.

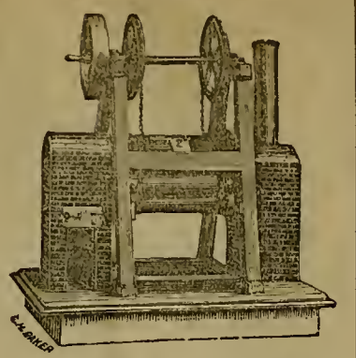
The Mechanics' Institute

AWARDED A

PREMIUM SILVER MEDAL

TO BRUCKNER'S

MECHANICAL ROASTING FURNACE.



Parties wishing to erect such Furnaces, are requested to leave their orders with

T. KALLENBERG,
12v11 416 Market street, San Francisco.

HUNT'S

IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN

HORSE POWER

For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

☞ For further Particulars see small circulars. ☜

E. O. HUNT,

No. 28 Second Street, and 108 & 112 Jessie Street, San Francisco. 26-3m

Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make,

COMBINING THE MAXIMUM OF EFFICIENCY, Durability, and Economy, with the Minimum of Weight and Price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.

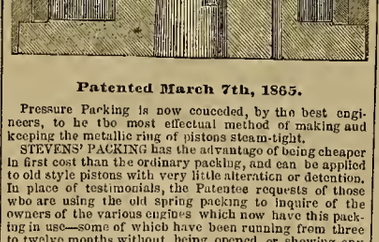
Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of milling enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Grist Mill's.

For sale by **TREADWELL & CO.,**
3v12-3m Corner of Front and Market streets.

Stevens' Pressure Packing.



Patented March 7th, 1865.

Pressure Packing is now conceded, by the best engineers, to be the most effectual method of making and keeping the metallic ring of pistons steam-tight.

STEVENS' PACKING has the advantage of being cheaper in first cost than the ordinary packing, and can be applied to old style pistons with very little alteration or detention. In place of testimonials, the Patentee requests of those who are using the old spring packing to inquire of the owners of the various engines which now have this packing in use—some of which have been running from three to twelve months without being opened, or showing any descriptive leak—and act upon their recommendation.

Further particulars can be had by applying to the Patentee, ANDREW STEVENS, Master Mechanic, Alameda Railroad, or at the VULCAN IRON WORKS, where they can be seen, at any time, in course of construction.

10df **ANDREW STEVENS.**

FOR SALE!

A STEAM ENGINE!

18-INCH CYLINDER, FOUR-FOOT STROKE, IN PERFECT Order. Inquire at VULCAN IRON WORKS, 137 and 139 First street, or to

HEYNEMANN & CO.,
26v11tf 311 and 313 California street.

VARNEY'S

PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the **PACIFIC FOUNDRY,**
1v1 San Francisco.

Prater's Patent Concentrator

(Known as HUNGERFORD & PRATER'S Concentrator,)

MANUFACTURED AT THE

San Francisco Foundry and Steam Engine Works.

Corner Fremont and Mission Streets.

HUNT'S PATENT

Circular Sweep Horse-Powers,

For running Churns, Washing Machines, Grindstones, pumping water, sawing wood, and other light machinery. Price, $100, at the Factory.

HUNT'S PATENT SELF-REGULATING TREAD HORSE-POWER is superior to any machine of the kind in the market. Price, with Governor, all complete to set to work, at the Factory, $300. Manufactured by

E. O. HUNT,
7v10 28 Second street, San Francisco.

Important to Miners.

NEW PATENT ROASTING PROCESS.

I AM NOW PREPARED TO OFFER TO THE MINING community a New Roasting Process, which has been approved as novel and beneficial by the best authorities in Europe. A Furnace can be erected in a few days at a trifling expense, and one man is able to Roast ten tons of Ore or Concentrated Sulphurets per day,

MORE COMPLETELY AND CHEAPER

Than any other Process. All the Sulphur is saved, by being converted into Bisulphide of Carbon, which is a valuable product, and will pay nearly all expenses.

For particulars, apply to

J. MOSHEIMER,
26v11-3m 423 Washington street.

QUARTZ OPERATOR'S

HAND BOOK

A Book for Every Intelligent Prospector, Shareholder, Miner and Machinist.

ZENAS WHEELER AND P. M. RANDALL,

Authors and Publishers.

BOUND IN CLOTH—144 PAGES, DUODECIMO.

THE QUARTZ OPERATOR'S HAND BOOK is presented to the public as a carefully prepared epitome of all that is valuable for the practical operator in the mine and mill. We have here all the most necessary hints and directions for testing and assaying the ores of the various minerals; an explanation of chemical terms; a brief and intelligible description of the numerous processes for roasting ores, and the extraction of metals from their ores by amalgamation and otherwise.

The work also contains an original and highly interesting discussion of the tracery and differently formed grinding plates, as applied to the reduction of ores—a subject not only of special interest to the scientific reader, but also practically of the highest importance to every quartz miner

Professor Silliman, of Yale, and Hodgson, of the College of California, having examined this discussion, as submitted to them by its author, Mr. Randall, previous to the compilation of this work, speak of the same as not only mathematically correct, but also as of great practical value. Messrs W. R. Eckart, Jr., Engineer, (late of U. S. N.,) and W. M. Belshaw, assayer and superintendent of the S. T. M. Co., to whom the entire work was submitted while passing through the press, speak of the same as one of high practical importance to quartz miners and millmen generally.

No work has been offered to the mining public of California which contains so much valuable information, condensed into so convenient a space as is here presented. In its preparation, much care has been taken to secure brevity, conciseness, and simplicity—in fact to make it a complete and reliable QUARTZ MINER'S HAND BOOK.

The Table of Contents of this book will be found on pa 415 of the MINING AND SCIENTIFIC PRESS of July 1st, 1865.

Sold by booksellers generally. Price by mail, postage paid, $1.25. Address "Wheeler & Randall, at the Mining and Scientific Press Office, San Francisco." 2v11

Removal.

The Office of the MINING AND SCIENTIFIC PRESS has been removed to the old printing stand known as Waters Bros. & Co., southwest corner of Clay and Sansome streets, opposite the Niantic Hotel (being one block south of our former location), where we may now be found, with more commodious apartments and an extensive JOB PRINTING OFFICE.

San Francisco, April 10th, 1865.

To Printers.

We have for sale, at a bargain, a Second-hand Half-Medium (largest size), Ruggles' Engine Job-Printing Press, of most approved pattern. It is in excellent condition, and warranted to work as good as new. Apply soon, at the office of the MINING AND SCIENTIFIC PRESS. 19v11tf

MILLS IN REESE RIVER MINING DISTRICT.

The Reese River *Reveille* still insists that our correspondent, "J. H. Ormton," is in error with regard to the number of mills in actual operation and in course of construction in Reese River District, and gives the subjoined as a correct list. The *Reveille* is correct in supposing that the only aim of the PRESS is to arrive at the truth. We give that paper the benefit of its own figures:

MILLS IN REESE RIVER DISTRICT AT WORK OR READY TO WORK.

Name.	*Stamps.*
Confidence	10
Midas	15
Keystone	20
Union	10
Long Island	5
California	10
Ware	5
	75

INCOMPLETE AND IN COURSE OF ERECTION.

Name.	*Stamps.*
Empire	10
Colmx	20
Manhattan	20
Boston and Nevada	10
Silver Hill	5
Pioneer	20
	85

Whole number of stamps in the Reese River District, complete and in the course of erection, 160. The Clifton mill, of four stamps, was long since abandoned.

MILLS IN AMADOR AND BIG CREEK.

Butte, Amador District	8
Metacom, "	20
Vanderbilt & Coral, Amador District	crusher
Eureka, Big Creek District	10
Parrott, " "	16
Phelps, " "	10
Lippett, " "	(or 5 stamps, abandoned)
	64

It will he observed that of the 160 stamps in the Reese River District, 75 are now ut work or ready to work, and the remaining 85 stamps are in the course of erection, and will in all prohability be finished and crushing ore between this spring and the ensuing fall. But at the present time several of theun are no more mills than naked walls and piles of building materials constitute houses. While we reasonably hope to have hundreds of mills reducing the ore from hundreds of mines in this district, the foregoing table exhibits their present actual number and condition.

IS THERE EMERY IN CALIFORNIA?—We have received from Mr. J. F. McKean, a specimen consisting of a mixture of minerals, very much resembling emery. The mineral is found in Sierra county, near the dividiug line between that county and Yuba, and not far from Camptonville. We understand that it has heeu employed in that vicinity, instead of the imported article, and that it has been found to answer a very good purpose. We have submitted the sample sent us to Prof. Blake, for a careful examiuatiou, and shall communicate the result of that examination in a future issue.

CLOTHING.—One of the largest assortments of ready-made clothing on the Pacific coast may be found at Quiucy Hall, on Washington Street, iu this city. This establishment also makes clothing to order. Call and see their clothing made from California cloth. You will find uo shoddy in *that*.

THE STOCKBRIDOE MINING CO., of Grass Valley, working on the dip of the old Watt vein, on Massachusetts Hill, are now taking out about fifty tons of very promising rock, daily. They will soon be able to take out one hundred tous per day.

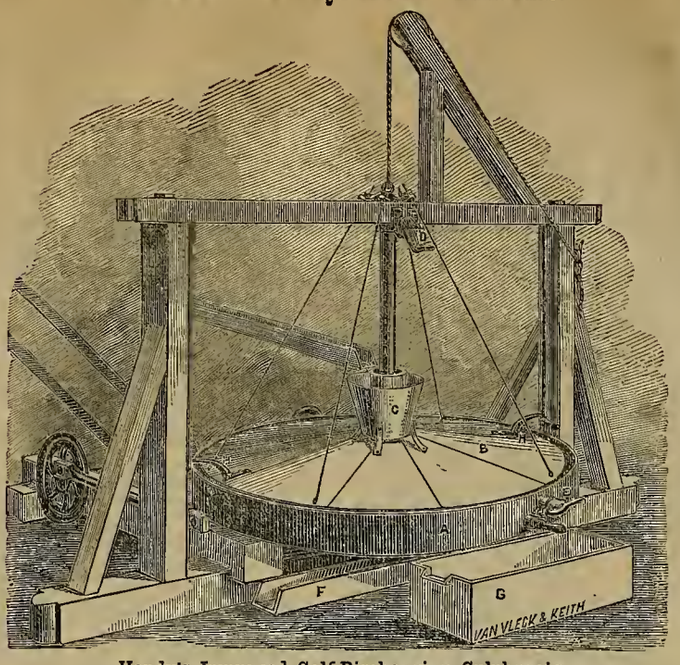
NOTICE TO QUARTZ MINERS.



Hendy's Improved Self-Discharging Sulphurets

PRATER CONCENTRATOR

Is Receiving Universal Favor.

Reference is made to the following Mills which are using the Prater Concentrator, with some of the Improvements attached. The Self-Discharging Sulphurets has been more recently adapted, and the public attention is called to examine its workings:

STEPHENS' MILL, Humboldt County, Nevada.
CHRYSOPOLIS MILL, " "
U. S. REESE RIVER MILL, Austin, "
CARROL & ASPINWALL MILL, Reese River, Nevada.
UNION MILL, El Dorado County, near Mud Springs.
NEW YORK AND EL DORADO CO., " "
BLUE LEDGE MILL, near Spanish Flat, El Dorado Co.
CONEY MILL, Jackson, Amador County.
Messrs. TUBBS & CO'S MILL, San Andreas, Amador Co.
WINTER'S MILL, Angels Camp, Calaveras County.
CLIO MILL, Jacksonville, Tuolumne County.

And in use in other parts of this State; also in Idaho, Arizona, Colorado and Mexico.

As a further evidence of its worth, orders have been received recently from the proprietors of the following mills, all of whom are using these Concentrators, or have works in the immediate neighborhood of mills using them, viz.:
One Concentrator ordered for the Coney Mill, Jackson, Amador County, by Messrs. Bigelow & Bro., of this city.
Three Concentrators for the Spring Hill Mill, Volcano, Amador County.
Two Concentrators for the Golden Gate Mill, Volcano, Amador County.
Four Concentrators for the Raw Hide Ranch Mill, Sonora, Tuolumne County.
They may be seen in operation at the GOLDEN STATE FOUNDRY, No. 19 First Street, San Francisco.
☞For explanation of the above engraving, and other particulars, send for a Circular

JOSHUA HENDY,
8v12tf No. 402 Montgomery street, Room 3, 4th floor.

MININ G RECORD
—AND—
INTELLIGENCE OFFICE.

We have established, in connection with this paper, a Mining Record and Scientific Intelligence Department, whore persons desirous can obtain information with regard to any particular Mine or Mining District. All information already in our possession will be furnished free of expense, on application at this office.

CONSULTATIONS, ETC.

Being in direct and constant communication with the best and most experienced Metallurgists and Practical Chemists in the country, we are prepared to hold consultations and furnish advice on all matters relating to Metallurgy and the application of Chemistry to the Arts. Manufacturers and others about to enter upon branches of industry comparatively new or but imperfectly understood, will do well to call upon us for advice. When desired they will be put in communication with such persons as will be best able to give them the latest and most reliable information and assistance upon such matters as they desire to be informed upon. No charge will be made by us for any service we may render in such cases. When experiments are required, or valuable information is sought, which must be obtained from EXPERTS, we shall leave them to make their own pecuniary arrangements with parties to whom we may introduce them; it being our aim to merely bring them in contact with reliable men, so that they may thereby avoid the immense pecuniary losses which are so frequently incurred in this country by pretentious charlatans, who manage to ingratiate themselves into the favor of those who are seeking for information upon scientific matters, or intricate and not generally understood branches of business.

Persons about to erect furnaces for Metallurgical or other purposes; and who may themselves not be personally acquainted with the work in contemplation, will find it to their advantage to consult us previous to entering upon any such undertaking.

MINING EXAMINATIONS AND REPORTS.

Persons desirous of obtaining full and reliable reports upon Mines or Mining Properties; or Survey and Maps of the same, etc., will do well to make application for such service through the especial agency connected with this office.

ASSAYING.

All orders for assaying will be promptly and faithfully attended to. Orders from the mines especially solicited.

☞ All supposed new minerals or organic substances will be reported upon free of expense to such parties as will send the same to this office free of expense of transportation; and when proper and consistent with the wishes of parties interested, notices of the same will be given through the columns of the MINING AND SCIENTIFIC PRESS, and the contributions placed on exhibition in our cabinet

DEWEY & CO.,
Publishers Mining and Scientific Press, 505 Clay Street, San Francisco.

A CHOICE ADVERTISING MEDIUM.

This week we issue an edition of 5,000 copies of tbo YOUTH'S COMPANION, ovory copy of whieh will be thoroughly scanned by moro than one pair of sharp little eyes, and the eontents of every page, from first to last, will be re-uttered by many active, lively tongues in the presence of over 4,000 of tho best families in this eity and State.

Although we are receiving many additional subscribers to our list in response to tho new enterprise in which wo havo engaged, we cannot expect, with the present high cost of printing paper, and our very low terms, to receive suffieient money from subscriptions alone to furnish as good a journal as we have determined to publish for our patrons; so we have widened tho eolumns of tbe paper and adopted smaller type, wbich admits moro letters in each line, and many more lines in each column of the paper, that we may havo room for a few more select advertisements in tho COMPANION *without decreasing in the least* any class of reading matter.

Our little journal circulates in more families than any other weekly published in San Francisco. No advertisements of the least objectionable character will be received, and as but a limited space will be devoted to this department, our young friends can safely inform their storekeepers, and other business acquaintances of these important facts for tho benefit of tho paper and all conecrned.

Remember, only a few columns of our regular issue will be devoted to advertising, and the moro profitable that class of patronage is made the greater will be the outlay upon our reading columns.

DEWEY & Co., Publishers.

THROUGH LINE TO NEW YORK,
Carrying the United States Mail.

LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M., on the **10th, 19th,** and **30th** of every month (except when those dates fall on Sunday, and then on Saturday preceding,) for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departure of the 19th connects with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America.

Departure of 10th connects with English steamer for Southampton, and P. R. R. Co.'s steamer for Central America.

Departure of the 30th connects with English steamer for Sumaco, the port of the new mines.

The following Steamships will be dispatched on dates as given below:

STEAMERS FOR MARCH.

10th—SACRAMENTO.....Capt. J. M. Cavarly,
Connecting with COSTA RICA, Capt. Manry.

19th—GOLDEN AGE.....Capt. E. S. Farnsworth.
Connecting with NEW YORK, Capt. Horner.

30th—CONSTITUTION.....Capt. F. R. Baby,
Connecting with HENRY CHAUNCEY, Capt. Gray.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

For Merchandise and Freight apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

MINING LAWS AND FORMS.

Third Edition revised and enlarged.

Compiled by H. B. CONGDON.

THIS Edition contains all the laws of the *STATE OF CALIFORNIA* and *NEVADA TERRITORY*, relative to Mining Corporations together with the Mining Ordinances of Mexico, complete; Digest of Decisions of the Supreme Court Forms etc. 16 mo. flexible cloth, 192 pp. $2.50.

Published by H. H. BANCROFT & CO.

Mining and Scientific Press.

A Journal of Useful Arts, Science, and Mining and Mechanical Progress.

DEWEY & CO., PUBLISHERS And Patent Solicitors. | SAN FRANCISCO, SATURDAY, MARCH 24, 1866. | VOLUME XII. Number 12.

TABLE OF CONTENTS.

Brear's Improved Valveless Steam or Air Pump—Illustrated.
The Miner's Inch of Water.
Important to Secretaries—The New Mining Law.
The Transmutation of Metals—Singular Developments.
Our Foundries.
The Location and Possession of Mining Claims.
The Petroleum Interest.
The Use of Sodium.
Silver Mining in Placer Co.
A New Rifle Box.
Is there Anthracite Coal in California?
The Tractory Curve and the Properties of Grinding Plates—No. 6.
Letter from our Regular Correspondent.
Properties of Bodies—A Tabular Statement.
Interesting Lessons for Children—The Philosophy of Combustion and of Breathing.
A General Guide and Business Directory of the Principal Mines in the Upper Country.
Mining Summary.
Editorial and Selected.
Mining Shareholders' Directory.
Stock Sales and Reports.
San Francisco Prices Current
New Mining and Other Advertisements, etc.

THE PETROLEUM INTEREST.

We learn, from private sources, that the Bennett Well still continues to flow water and oil at about the same rate as heretofore reported. The work of boring is still going on, and, it is said, that the yield of oil perceptibly increases.

The Tompkins company, at Pescadero, who have been for some time prospecting the surface sand-rock on their ground, have recently put up a new and larger retort, from which they are obtaining still more satisfactory results—and much better than they had anticipated. Their rock is said to yield about 40 gallons of, crude oil to the ton. They find, in practice that with three men, they are enabled to collect and work two tons of rock a day; thus producing, at a cost of $7.50, eighty gallons of oil, worth in this city forty cents per gallon. We have thus—

80 gallons of oil, worth	$32 00
Labor of producing the same	$ 7 50
Freight and cost of packages	12 00— 19 50
Profit	$12 50

Twelve dollars per day profit on the labor of three men, with only the investment of a common ⊃ gas retort, is a pretty good business, especially when the number of men and retorts may be indefinitely increased. We may be mistaken in the figures; but we have endeavored to give them correctly. Pennsylvania has recently been boasting of her newly found wealth in the immense extent of her oleaginous surface rock, or sand, recently discovered. If we are not misinformed, California also possesses an inexhaustible quantity of such rock equally as rich as any found in the Atlantic States. We can make a good thing out of this, even if we don't get flowing wells.

New Patent Sluice Box.—R. E. Washburn, of this city, has just received, through the Mining and Scientific Press Patent Agency, Letters Patent of the United States for a new improvement in sluice boxes, which consists of an easy and effective method for saving the precious metals, in sluice or hydraulic mining, by placing one or more boxes along a flume, each box having an inclined floor, upon which is placed tapering bars or teeth, arranged in a row, at suitable distances. Underneath the upper end of this box is placed a hollow cast-iron box, with riffle bars placed across it; in this box quicksilver is placed, for the purpose of amalgamating the metals, the whole being closed by means of a door, which may be secured by a lock. By this arrangement no quicksilver can escape, or amalgam be stolen, as is often the case, by robbers, for the door may be locked, or the box be removed to a place of safty at night.

BREAR'S IMPROVED VALVELESS STEAM OR AIR PUMPS.

The pumps, illustrated in the annexed engraving, are improvements upon a former patent of Mr. Brear's, granted April 1st, 1862, and reissued October 27th, 1863, and which is now the property of a Company; but is not designed to work coarse gravel.

Fig. 1—LITTLE GIANT.

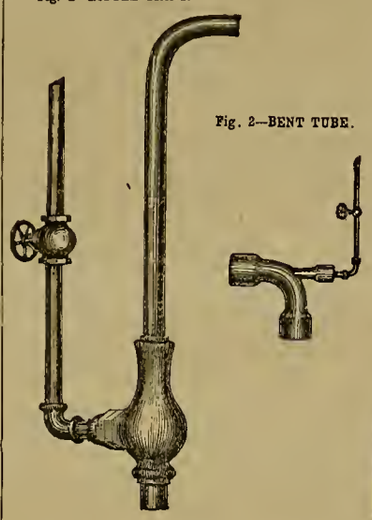

Fig. 2—BENT TUBE.

Following is the inventor's description of the pump, and what he claims to be its capacity:

Figure 1 is particularly designed for the purpose of forcing water or other liquids. Fig. 2 is for water, or for sand and gravel with water, which may be required to be raised or displaced.

Figure 1, or the Little Giant, is now at work in large numbers, bilging steamboats, etc., in and about New York, Boston, Philadelphia, and other harbors. It can be used to elevate water in breweries, distilleries, sugar refineries, for pumping out cellars, irrigating land, etc.; or where water or other liquids are required to be raised upwards. It may be employed for filling locomotive tanks or tenders, by placing it permanently in wells, rivers, or ponds convenient to the roadside, and connecting it, by means of a steam hose or swing joint, with a stop cock on a locomotive boiler, whenever it is required to take in water; or it can be carried upon the tender ready to be used at any station or place where water can be obtained from any source.

This pump will bilge a low or high-pressure steamboat, and deliver the water at a rapid rate. It is also useful to sweeten a boat; as fresh water can be let into the bilge, and delivered quickly by its agency, by which means the boat may be kept sweet and healthy. If there is no water in the bilge, by letting the steam through it, foul air will be removed, such as is consequent from air being confined under the ceiling, between the planking. By connecting a tube to the outlet pipe, and leading this under the grates or fire of the boiler, and shutting off a cock in the outlet delivery pipe, it will be found to answer the purpose of a blower, on account of the air passing with the steam. The combustion is thereby greatly increased, saving coal and economizing fuel by getting a larger per centage of heat from a less amount of coal. By changing two cocks it is ready for bilging again, or *vice versa*.

The great rapidity with which it delivers water is wonderful. Its advantages are that sand, slum, and such like substances do not obstruct its operation. Its simplicity also recommends it; there being no working parts, it cannot get out of order.

Figure 2 is an open pipe from end to end, and is designed for mining or wrecking, raising sunken vessels, or displacing sand or mud, forming bars in navigable streams or rivers, to improve navigation. It will work submerged, or will raise sand, gravel, mud, or slum from the bottom, from any depth up to and above the surface of the water, whence it can be conveyed away to any desirable point. It can be used on sand bars, or in quicksands, and in or on the beds of rivers. It will drink and deliver up into a sluice, or other apparatus set upon a level surface, sand, gravel, or slum, with water. Several hundred tons of such matter, per day of ten hours, can thus be moved with one hundred pounds pressure applied to it. It will also wreck a steamboat that carries a high pressure, and is invaluable for that purpose; and no steamboat should be without them, especially where snags and other dangers exist; for two of the four-inch sizes will keep a vessel with a large opening made by such, above water with ease, thereby saving life and cargo. Also, by having one ready with hose, a sinking vessel can be freed from water and towed into port in safety, when the pump is applied as above described for use on railroads. Further particulars can be obtained from the patentee, or from the proprietors of the Miners' Foundry, 245 First Street, where the pumps are on exhibition and kept for sale.

Mr. Brear is sole owner of the improvements and offers for sale State and county rights, reserving to himself the right to manufacture, giving parties who purchase rights the benefit of one-half the price list. He has come amongst us for the special purpose of introducing them here for mining and other purposes. Mr. B. is also the first inventor and patentee on record of any apparatus of this kind. The improvements herewith illustrated were patented October 25th, 1864, and August 29th, 1865.

"Transmutation of Metals."—We would invite attention to an article, in another column, on the transmutation of metals—especially to the concluding paragraphs, giving certain formulas, etc. The main portion of the article is a translation from a French paper received by the last steamer. The parties named as having pursued the curious investigations described, are of high scientific standing in Paris. We give the article for what it is worth. The experiments can and doubtless will be tried in this city.

The Hydrostatic Mill.—The Amador *Ledger* says that the quartz mill, driven by one of Hansbrow & Redding's hydrostatic engines, and erected by Judge Clark, Mr. Nichols and others, at Irishtown, is now in successful operation, and fully meets the expectation of its enterprising proprietors.

OUR FOUNDRIES.

Work at the principal foundries in this city is brisking up, and we are repeatedly told by different proprietors that the prospects for full orders for the approaching season are unusually promising. New quartz mills seem to be the leading inquiry.

THE GOLDEN STATE IRON WORKS

Have shipped this week a fine lot of machinery for the New York Moss Association, to Arizona. Chas. L. Strong is the new Superintendent of this company. The machinery, above mentioned, comprises one 40-horse-power engine, 12 x 24-inch cylinder—one of the best ever turned out in this city; two five stamp batteries, with mortar independent of the framework; three of the Wheeler & Randall tractory pans; two Knox pans, two 7-foot separators; one large portable 10-ton derrick; framework for tanks, mills, etc., complete. The Moss Association have exhibited good judgment in securing the manufacture of their machinery here, in place of attempting to procure suitable work in New York. Under the present management we shall expect to hear favorable reports from the mine.

The Golden State Works are now finishing up a large propeller, and other steamboat work. They are also manufacturing a large number of Dunbar's Steam Packing Rings, which are being introduced into all the locomotives on the San Francisco and San Jose Railroad.

We shall take occasion to visit other foundries and report further from week to week.

Meeting with Success.—We are credibly informed that Leffels' American Double Turbine Water Wheel is being successfully introduced in Oregon and other northern sections of this coast. It is also stated that the principal establishment engaged in the manufacture of these wheels in the Eastern States has been driven with work recently. Messrs. Knapp & Grant, commission merchants, at No. 310 Washington street, have recently been appointed agents for the sale of the American Double Turbine Wheels. They are also agents for Leffel's Patent Lever Jacks, which are very useful and efficient articles in that line. Further information will be obtained concerning the above named instruments by reference to our advertising columns, or by calling upon the agents.

The Attention of Mining Corporations is especially called to the fact that Senator Robinson's bill, concerning assessments of corporations, has passed the Legislature, and will doubtless become law within a few days by receiving the approval of the Governor. It is an important and desirable improvement on the old statute, and will be hailed with satisfaction by all parties interested in corporations.

Properties of Bodies.—We are indebted to the "Annual Circular of the Miners' Foundry, for 1866," now being printed at this office, for the very excellent and useful table giving the various properties and characteristics of a large number of such bodies as most commonly occur in nature.

An iron tank, with a capacity of 57,000 gallons, is building at New Bedford, Mass., for a petroleum company. It will take quite a strike to fill it.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

THE TRACTORY CURVE, AND THE PROPERTIES OF GRINDING PLATES.

BY W. A. GOODYEAR.

[continued from page 162.]

Let us now consider what takes place when the upper plate revolves.

I will first take the simpler case of plane circular plates of uniform hardness.

From the definitions given upon page 102 of the Hand Book, it follows that the measure of the grinding effect produced by two rubbing surfaces is the product of the area rubbed, into the normal pressure per unit of area, into the distance passed over.

Moreover, the *wear* at any particular point of the surfaces is proportional to the product of the pressure per unit of area at that point, into the distance passed over by the point; *provided*, as above, that the form of the surfaces allows this law to hold true, which it evidently does in the case under consideration.

Now, in plane circular plates, the pressure perpendicular to the surfaces of contact (the vertical pressure) is constant, so long as they remain at rest. Represent this pressure per unit of area by R.

Suppose now that the upper plate begins to revolve. The distance then passed over by any point of the surface is proportional to y, if y represents the radius of the circumference described by the point. The *wear* at this point, then, would be proportional to R y, if the pressure remained constant, and the apparent result would be that such plates would wear away more rapidly at the circumference than nearer the center, leaving them of such a form that they would touch each other only at the center, while the rest of the surfaces would be separated by a space increasing from the center outwards.

But this is evidently an absurd and impossible result of grinding; for surfaces cannot wear each other away where they are not in contact. Yet, this is the assumption upon which certain calculations of grinding effect in the Hand Book are based.

So far from this being true, on the contrary, the plates *actually* wear down evenly and uniformly over their whole surface.

When the motion begins, therefore, the vertical *pressure*, though originally constant, does not remain so, but *must* accommodate itself to the new condition of things, and vary, therefore, in such a manner that its product into the distance passed over at each point shall be constant. It must in this case, therefore, vary inversely as y, or directly as $\frac{1}{y}$.

Let now the actual pressure per unit of surface at the circumference, when the plates are in motion, be represented by P. Represent, also, the pressure at any point whose radius is y, by P′. Then if a denote the radius of the plates, we have

$y : a :: \mathrm{P} : \mathrm{P}'$, therefore,

$$(62) \qquad \mathrm{P}' = \mathrm{P}\frac{a}{y}.$$

The distance passed over by the point in one revolution is $2\pi y$. The grinding effect is, therefore, represented by

$$(63) \int 4\pi^2 \mathrm{P}\, a\, y\, dy = 2\pi^2 \mathrm{P}\, a\, y^2 + \mathrm{C}.$$

Taking this integral between the limits 0 and a, we have the total grinding effect by one revolution of the plates

$$(64) \int_0^a 4\pi^2 \mathrm{P}\, ay\, dy = 2\pi^2 \mathrm{P}\, a^3.$$

Suppose, now, that the plates instead of being of uniform hardness, increase in hardness from the center to the circumference in the ratio of the increase of the radius, or in other words, that their hardness varies as y.

The actual wear of the plates still remains uniform, for the same reason as given above, viz., that plates cannot wear where they are not in contact. But as now, what may be called the tendency to wear at any particular point is decreased by the increasing hardness of the plates in precisely the same ratio as it is increased by the increase of the radius, and, therefore, of the distance passed over, the conditions here not only allow, but require, that the *pressure* shall still remain uniform when the upper plate revolves. Call this pressure P. The grinding effect then, for a single revolution, is represented by

$$(65) \int 4\pi^2 \mathrm{P}\, y^2\, dy = \frac{4}{3}\pi^2 \mathrm{P}\, y^3 + \mathrm{C}, \text{ and}$$

taking this integral between the limits 0 and a, we have

$$(66) \int_0^a 4\pi^2 \mathrm{P}\, y^2\, dy = \frac{4}{3}\pi^2 \mathrm{P}\, a^3.$$

Let us now consider Randall's Patent Grinding Plates, in which each *set* of rings is uniform in hardness throughout, but the inner set is only one-third as hard as the outer set, a being the outer radius of the plates, and $\frac{a}{3}$ the inner, and $\frac{2a}{3}$ the outer radius of the inner rings.

Let P denote the pressure at the circumference of the outer rings.

Taking, then, the integral in (63) between the limits $\frac{2a}{3}$ and a, we have the grinding effect of the outer rings in a single revolution,

$$(67) \int_{\frac{2a}{3}}^{a} 4\pi^2 \mathrm{P}\, a\, y\, dy = \frac{10}{9}\pi^2 \mathrm{P}\, a^3.$$

Since the outer rings are of uniform hardness, we have from (62) the pressure on the inner circumference of the outer rings, $\mathrm{P}' = \frac{3}{2}\mathrm{P}$. The actual wear must, necessarily, be uniform on both rings, else the plates would not remain in contact, which they must do in order to grind at all. Therefore, since the inner rings are only one-third as hard as the outer ones, we have the pressure on the outer circumference of the inner rings, $\mathrm{P}'' = \frac{\mathrm{P}}{2}$. Therefore, for the grinding effect of the inner rings in a single revolution, we have

$$(68) \int_{\frac{a}{3}}^{\frac{2a}{3}} 2\pi^2 \mathrm{P}\, ay\, dy = \frac{1}{3}\pi^2 \mathrm{P}\, a^3.$$

The total grinding effect of these rings in a single revolution is, then, $\frac{13}{9}\pi^2 \mathrm{P}\, a^3$.

[To be Continued.]

Elegant Testimonial.—We had the pleasure, a few days since, of examining an elegant and appropriate testimonial, prepared by order of the Andisonian Society of this city, to be presented to the Rev. Dr. Peck, of the Howard Street M. E. Church, previous to his departure for the East, which will take place on the 10th of April. The testimonial consists of a copy of the Bible, elegantly bound, expressly for this purpose, and containing within its folios sheets of a photographic album, pierced for sixteen photographs, which are to be filled up with the pictures of the present and past officers of the Association, sixteen in number. Upon the front lid of the Bible is the following inscription:—"Presented to Jessie T. Peck, D.D., by the Addisonian Society. March 23d, 1866." The cost of the volume was $40.00. The doctor was the founder of the Association.

[Written for the Mining and Scientific Press.]

From Our Regular Correspondent.

[Continued from page 163.]

The lead which was the object of our visit is located one and a half miles south of the Mina Rica, between the Middle and South Forks of the Mokelumne, and is consequently in

THE SANDY GULCH DISTRICT.

This is the only mine on this side of the Middle Fork of which I had any opportunity of making a personal examination. It is known as

THE SWEDENBORG CLAIM,

And consists of a location of 2,000 feet in length, on a ledge lying in a slate formation, which bounds the granite range of West Point on the eastern side. The vein was worked by Mexicans some six years since, and was then opened on the surface for about 300 feet in length, and proved to be very rich down to the water line, which here comes in at twenty five feet. The work done by Messrs. Anderson & Smith, the present owners, consists of sinking two shafts, one twenty-nine, and the other thirty-four feet deep, about thirty feet apart, and connecting their bottoms by a straight inclined drift. Mr. A. says that on the bottom of this drift, (it contained water at the time of our visit), the vein was two feet wide at the bottom of the deeper shaft, and fourteen inches at the other, and the large blocks of solid quartz and sulphurets, lying near, were proof incontestible of the vein being at least of that size. Below the water line, the quartz was for a while perfectly white and apparently barren, but after sinking in this about three feet, they struck rock which is nearly half sulphurets, galena, iron and copper pyrites, and what appeared to be traces of arsenic, in solid masses of hundreds of pounds in weight. Some of this rock was exhibited at the late Mechanic's Fair at San Francisco, by Mr. Lidstrom, and was pronounced valuable, though no one seems to know the exact result of any assays or workings. Mr. Mosbeimer is said to have assayed some of the sulphurets, which gave as high as $600 per ton, and a working test made by some one in the city is put down at $45.85.

This district (Sandy Gulch) like West Point, is abundantly supplied with wood and water, the latter being supplied by the ditches at from three to five cents an inch, miners' measure for twelve hours.

I am indebted to Mr. Kadish, owner of one of the ditches which supplies the district with water, for notes on three ledges, which he describes as being owned by Dr. Foote of Camanche Camp, and which I was prevented by want of time from visiting personally. They are the Pioneer sulphuret lead, which is opened to a depth of thirty feet, and shows an immense mass of sulphurets of iron and lead from four to five feet in thickness, lying in a northwest and southeast direction, in granite walls, and rock from which, is said by Mr. Kadish, to have paid $25 per ton in an ordinary stamp mill; the Cedar Gulch, two and a half feet wide, and said to pay $100 per ton, and the Sailor Flat, which has been opened seventy feet deep, and is said to pay $30 per ton. No work is at present being done upon these claims, as the owners are scarce of capital and desirous of selling them. They are located within one-eighth of a mile of each other, and would, if they continue as rich as they now are represented to be, form a very desirable investment. The ground claimed on each is 2,000 feet.

The Hidalgo lead is located near Sandy Gulch, and is owned by some Mexicans who claim 1,400 feet. I am informed by Mr. K. who owns a small interest, that the ledge is thirty inches wide, and that the rock now taken out is yielding $120 per ton in arastras.

HARRIS'S MILL

Is located in the village of Sandy Gulch. It is connected with a saw-mill, and both are driven by the same wheel, a splendidly built overshot, thirty feet in diameter, and by far the best wheel that I have seen in this part of the county. The mill contains a battery of five stamps, each of 500 lbs. weight, and capable of crushing four and a half tons of hard rock to very fine powder every twenty-four hours. As much gold as possible is first caught by mercury in the battery, after which the blanket washings are ground and amalgamated in "Brevoort pans," five of which are in use in the mill. It is the intention of the Messrs. Harris to introduce some one of the best approved concentrators instead of the blankets, as they will require less labor and attention. The price of crushing at this mill is $4.50 per ton.

At the request of parties in West Point and Sandy Gulch, who are interested in the mines of that district, I visited

THE BLUE MOUNTAIN DISTRICT.

A horse was furnished me by Mr. Oztarena of Sandy Gulch, and on Friday morning I left West Point in company with Mr. Zavale, of that place, who kindly consented to leave his business to become my companion and guide on the trip. A very pleasant ride of fourteen miles brought us to Blue Mountain City, the business center of the district, a town that once numbered its inhabitants by hundreds, and boasted two hotels, two livery stables and several stores, but which now contains twenty or thirty empty houses, and two occupied ones, with a population of just three. The first ledge opened in this district, and the only one on which work is now carried on, is

THE HECKENDORN,

On which work was commenced in 1863. The formation of the walls is diorite, which, in fact, is the prevailing rock of the district, intersected here and there by broad dikes or belts of "quartzite," as it is called here, a quartz rock noted for the regularity of its cleavage, and its compact character. A belt of this over 100 feet in width cuts off the Heckendorn vein at the south end of the claim of the Heckendorn company, and in tunneling through it, much of it is seen to show indications of silver. The course of the ledge is nearly north and south, with a dip to the westward of forty degrees, and as far as opened is from two to four feet in width, averaging at least thirty inches. The first tunnel run upon this ledge, was driven in a distance of 110 feet, on the ledge, and opened it forty feet beneath the surface. Below this tunnel a shaft has been sunk to a depth of sixty feet, the vein showing itself strong and clear all the way down. About 120 tons of ore taken from this shaft is now lying at the mouth of this tunnel, which is valued by Mr. Zavala, who has long been familiar with silver ores in Mexico, at $100 per ton. A small water mill was erected by the company last summer, but as the power proved insufficient it was given up. The mill consists of four stamps, and a Hepburn & Peterson amalgametor, driven by water power. Some thirty or thirty-five tons of ore were worked, which, paid, as I was told by Mr. Staples, $51 per ton in the pan. One and a half tons of the tailings were roasted by Judge Morris in an open wood fire, and ground in an arastra extemporized from the "settler" of the H. & P. amalgamator, and produced two bars of bullion, each over fourteen ounces in weight, and valued at six dollars an ounce. Mr. D. C. Staples, who is also a stockholder in the company, has been engaged during the past autumn and winter in running a tunnel to cut the ledge 100 feet below the first one. It has already reached a length of 100 feet, the extent of his contract, and it is believed that the lead can not be more than two or three feet ahead. Mr. S. has taken another contract for fifty feet more of tunnel, which it is thought will develop it sufficiently to ascertain pretty accurately its true value, when it is intended by the company to put up a good steam mill and go to work in earnest. The claim of this company is 1,200 feet in extent. North of the Heckendorn on the same vein is located

THE CELINA,

Claiming 3,600 feet. A shaft eighty feet in depth has been sunk by this company and a considerable quantity of ore taken out, which is almost exactly like that of the Heckendorn in every particular, being a white brittle quartz, plentifully charged with iron pyrites, and blue sulphurets of silver, besides showing occasionally some free gold. Extensions of this ledge are taken up for miles, both north and south, but as little has been done upon them, they need not be mentioned by name.

About one-fourth of a mile west of the Heckendorn, is

THE STAR OF BLUE MOUNTAIN,

On which a French company claim 3,200 feet. The course of the vein is northwest and southeast, and it was first discovered on the top of a steep ridge, which runs along past and back of Blue Mountain City. A tunnel has been run into the ridge a distance of over 300 feet, cutting the vein nearly at right angles, at a depth of 175 feet. The ledge is at least twenty feet wide, strong and well defined, and containing from four to six feet of fine looking silver ore, which is said to work over twenty dollars per ton, nearly all silver.

About four o'clock, Mr. Zavala returned to West Point, but prompted partly by a desire to see more of the wonders of the district, and partly by the earnest solicitations of Mr. Staples, I accepted of his hospitality for the night, and next morning resumed my observations.

The first claim visited in the morning was that of

THE HOOD HUNTER COMPANY,

Located one and a half miles southwest of Blue Mountain City. The claim of this company consists of 3,200 feet, on a ledge running north and south, and having a dip to the east ward of thirty-five degrees. A shaft has been sunk thirty-five feet deep, in fine looking quartz all the way. A drift has been run across the vein a distance of thirteen fe t, without finding the hanging wall, (the shaft follows the western or foot-wall). The rock near the surface was partially decomposed, and assayed $200 per ton in gold, but in going down, the quartz shows a very large percentage of auriferous galena, evidently very rich, though I was unable to learn the amount it assayed. Several extensions have been located on this vein, all of which show ore of a similar character.

THE LOYAL LEAGUE COMPANY,

Located two miles south of Blue Mountain City, claim 2,400 feet on a vein running north and south, which crops out in a gulch, some ten or twelve feet thick. But little work has been done, and the dip of the vein cannot be accurately determined, but it appears to be about sixty degrees to the eastward. The ore is similar in character to that of the Good Hunter, but is only found in streaks through the vein as yet, though it will probably be more abundant as it is explored to a greater depth.

THE IMPERATRICE

Is situated half a mile south of Blue Mountain City, and is opened by a tunnel between 400 and 500 feet in length, cutting the vein at a depth of from 300 to 400 feet, where it is about seven feet wide. The ore shows considerable sulphurets, and is said to pay twenty-three dollars per ton. It is claimed by a French company, who, like all the others except the Heckendorn, have been compelled to suspend operations for want of means. There are a great many other claims in the district, but those described include most of those on which any considerable work has been done, and will furnish a fair illustration of the character of the ledge in that section.

The district is easy of access by good roads, at almost all seasons of the year when it is possible to travel anywhere, is abundantly supplied with timber, and with water for steam and amalgamation purposes the year round. The climate is temperate and healthy, and the scenery fine. The ledges have been prospected sufficiently to fully test their permanency, if not their value, and one at least is found to produce very rich ore. Taking all these facts into consideration, I know of no part of the State furnishing greater inducements to the investment of capital for its development than Blue Mountain.

On my return to West Point, I proceeded at once to Mokelumne Hill, where I remained until Monday morning, when I procured a horse of Mr. Dowling of that place, and started for

RAILROAD FLAT.

The section of country described under this name consists of the watershed between the Mokelumne and Calaveras rivers, and includes the Railroad Flat, Independence, and Equal Rights mining districts. The country is principally of slate formation, with drift overlying the slate, furnishing in many places valuable placer diggings which it is believed will pay well for working by the hydraulic process, and which will apparently last for ages. The drift is frequently crossed by ridges of lava, such as in other parts of this county and Amador are often found to cover the beds of ancient rivers, which are filled with auriferous gravel. The country has been from some cause but little prospected, probably one very important cause was the fact that a few years since a lawsuit occurred, which for a time deprived the miners of the whole section of water. It is well supplied with timber, and water is now abundant at twelve and a half cents per inch. About noon I arrived at the residence of Mr. Warren V. Clark, who with his partner, Mr. Woodbury, now owns the ditch which supplies the district with water. After dinner, Mr. Clark proposed that I should remain over night, and that we should spend the afternoon rambling over the neighborhood, seeing the sights and "taking notes" of things. Near his residence, and some eight miles above Rich Gulch, is located Mr. Clark's saw-mill. It is one of Hendy's Patent Circular saw-mills, and is considered by the owner a very successful affair. The power is furnished by an overshot wheel forty feet in diameter, and four feet wide. The framework and setting of the machinery are the work of Mr. Woodbury, a partner of Mr. Clark, and are of such a character as to reflect the highest credit upon his mechanical skill.

HYDRAULIC MINING.

The placers of this district not being on the whole very rich, the only profitable way of working them is by the hydraulic method. This, owing to the fact of the great distance of most of the claims from any points in the ditches sufficiently elevated to give the necessary fall for this work, requires an expense for purchase of pipe, hose, etc., too great for the ordinary miner to afford. Mr. Clark has attempted to test the matter by trial and thus far by flattering prospects. By the use of 3,100 feet of iron pipe, he has obtained a pressure of 225 feet, which is sufficient to clear away the ground with a speed which "astonishes the natives," and would do credit to any company of miners in Nevada or Yuba counties. The pipes are of Nos. 16 and 18, sheet iron, the main pipes being eleven and thirteen inches in diameter, and the "hose," as he calls them, or working pipes, are seven inches. No canvas hose is used, except in places where it is necessary to bend the pipe, the rest being all iron.

THE QUARTZ INTEREST

In this district is in its infancy. In a district ten miles square the only means of crushing is a hand mortar, four inches in diameter, with a broken pestle. I did not even see *this*, I only heard of it. Several ledges have been discovered and partially prospected, the principal of which is

THE COL. WATKINS CLAIM,

As it is called from the fact of a man of that name having erected an arastra and crushed some rock from it many years ago, which was said to have paid $16 per ton. This lode has been traced for a long distance and located, and opened at many different points at most of which it shows considerable gold. The course of the vein is nearly north and south, it has not yet been opened sufficiently to fix upon its dip with accuracy. The location farther south, and nearest the saw-mill, is that formerly held by Col. Watkins himself, and consists of 1,000 feet, now claimed by Messrs. Clark & Woodbury, and some of their employees. The next, known as the Two Dollar Gulch claim, is claimed by Messrs. Zane, Ellsworth and others, known here as the New York boys, who hold 800 feet. Still further north is the Jeffries claim of 800 feet, and other extensions are claimed for a full mile. On both of the principal locations the rock appears well, showing considerable free gold. A package of 130 pounds of quartz from the claim of Mr. Clark on this vein is at present in the hands of Mr. G. Pardon of San Francisco, for the purpose of being tested.

Another ledge has been struck at Nobility Flat, three miles south of Clark's mill, by some Germans, which is said to prospect well. It is from nine inches to three feet wide, and it is believed will pay $40 per ton.

THE NEW YORK CLAIM

Is located on a high hill, some three miles north of Clark's mill. The company claim 2,000 feet on a ledge running north and south, with a dip to the east of thirty five degrees. It has been opened to a depth of fifty-eight feet by two shafts, thirty-four feet apart, connected by a drift forty-three feet below the surface, the rock prospects well. The boys have worked under very discouraging circumstances, but seem to feel sure of making their fortune yet. I sincerely hope they may.

Mr. Clark is making a vigorous effort to get capitalists to come into the district, and put up a custom mill, and the terms that he offers are such that some one ought certainly to be found who would do it.

On my way down this afternoon, in passing the residence of Col. Rust, he stopped me and taking me into his garden, showed me where in digging to plant a grapevine, his boys had struck a quartz lead. It appeared to be about a foot wide. Nothing is known about its extent, but the quartz looks well. The country is looking up. D.

Rich Gulch, Calaveras co., Feb. 1866.

RE-OPENING OF THE SCHOOLS.—Notwithstanding the prediction of the *carpers* that the Public Schools would not open again until the 1st of July next, they *did* open promptly on Monday morning last, and will continue, as heretofore, throughout the year. Through the efforts and representations of Superintendent Pelton, and other friends of the Public Schools, the Legislature promptly passed the relief bill asked to meet the present extraordinary emergency. The bill also makes ample provision for the future wants of the department, both in the matter of school houses and the payment of old debts, and before another year comes round, the city will be able to own its own school buildings, and to have enough of them to accommodate all its children. This is as it should be, and is nothing more than every sincere friend of public education confidently expected from the wise and intelligent body of men which constitutes the present Legislature of California.

THE art of WRITING is the most miraculous of anything which man has devised.

[Written for the Mining and Scientific Press.]

Have we Anthracite Coal in California.

EDITORS PRESS: In your issue of the 10th inst., you mention the arrival of a small lot of anthracite coal from British Columbia by steamer Labouchere; and believing, as I have constantly expressed myself to you and others, that contrary to the declarations of Silliman Whitney, Gabb, Jackson and others, such coal was to be found on this coast when sought for in the right localities, I was therefore much pleased at the probable solution of the problem. I immediately visited the steamer, and announcing to the first officer—the captain being absent—the object of my call, he very kindly removed the hatches and ordered a search for pieces, a few of which only remained on board, as the sacks containing it had been removed. When found, I was much pleased with its appearance. It is evidently not so heavy as the anthracite imported here from Pennsylvania, and contains probably more volatile matter and somewhat more ash. Indeed the analysis, as I subsequently found in your issue of the MINING AND SCIENTIFIC PRESS of September 16th, 1865, made at Victoria by Mr. F. Claudet, of the Government Assay Office at New Westminster, shows this very supposition to be true.

Some of this coal was tried at the Vulcan Foundry a few days since, and on inquiry, the proprietors stated that while they were pleased with it as a fuel, it is not equal to imported coal in hardness and freedom from gas, requiring somewhat more in quantity, and a little more flux.

Now the question arises, can anthracite be found in California and near home; and if so, why has it not be found? I answer, anthracite coal can be found in Oakland and so on to Mission San Jose, but it will lie deep. It can be found near the surface in the hills to the southwest of the New Almaden quicksilver mines. It can be found near the surface with a comparatively small amount of exploration, at any point along the mountain range in which the sedimentary rocks resting upon the mountain have been highly tilted. Now the tilting of these beds is due to the protrusion of associated trappean and metal bearing rocks, which rocks are thrust to the surface subsequent to the complete deposition of the sedimentary series, including the three series of coal, thus lifting up and breaking the sedimentary strata, and revealing to man these stores of fuel, which otherwise would in most cases, without any aid from science, remain undiscovered. Especially is this true of the anthracite series, which lie deep down, and probably only by this means would ever be revealed.

To better understand the matter, let me state a few facts, as I deem them, in relation to the physiography of the earth's surface—a science which underlies the science of geology itself, and which needs to be fully apprehended in order to make an intelligible science of geology:

The earth's surface is divided up into mountain ranges and coal basins. The mountain chains may be divided into the main metal bearing chains, and into divergent chains, which are not productive of either gold, silver or copper, *in veins*; but which do contain cinnabar, and some irregular deposits of copper. The Sierra Nevada mountains, the Rocky mountains and the Alleghanies, are the main mountain chains of the North American Continent. The course of the Sierra Nevada is about true north, or about 15° to 17° west of Magnetic North. Hence we say, ordinarily, that their course is about N. N. W. by compass. The course of the Alleghanies is northeasterly. Now there are other mountain chains which I have called divergent for the following reasons. The course of the Oakland chain is about west and by north. The Santa Cruz or Gabilan mountains; the Monterey or San Lucia mountains and Point Conception, which is part of a parallel range, all have the same course. These last named all terminate abruptly on the ocean, and therefore there is no such thing as a coast range of mountains. The sedimentary rock can be seen on either flank, dipping down toward their respective basins. Now let any one make a diagram, and suppose the Sierra Nevada to be 100 miles east of the coast of the Pacific, running a N. N. W. course, and the space between the mountains and the shore divided by west and by north lines, or mountain chains, about thirty miles apart from each other, and these spaces or troughs between filled with the entire sedimentary series, coal and all; and you have a bird's eye view of the physiography of the Pacific coast.

You may apply this proposition to the Atlantic side of the continent, and although the Alleghanies run northeasterly, its system of divergent chains show the same north by west, and south by east course. We have the Blue Mountains of New Jersey, we will suppose, as a point of departure. Then going east we find a mountain chain terminating at Throg's Point; again, another chain at Stonington, Conn. Again, from Fall River and Newport to New Bedford, we find granite, which is never found, except as mountain; again at Quincy, Mass., and again still at Plymouth, Maine. When geological search and explorations shall have thoroughly investigated the matter, I apprehend it will be found that *this is the true physiological outline of the entire earth's surface.*

If, then, this proposition be true that the coal of the earth's surface lies in these troughs, and that these troughs all follow a west by north and east by south course, then we have made a fixed, definite mathematical point; and, fossils aside, the mountain chain which fix the sides of the valley, and the course and position of the strata is our point of departure in our coal and petroleum explorations.

Now the position of anthracite coal is unsettled. Some geologists contend that it is found in the same beds with the bituminous coal. I do not think so, as a proposition, and were I writing an exhaustive dissertation, which I am not, I would show otherwise. I assume that anthracite coal is only to be found *in situ*, in connection with the black clay slate rock; the true geological position of which is about one quarter of a mile from the base of the mountain either side, into the valley or trough. Bituminous coal is found about one and one quarter miles from the base of the mountain, and cretaceous, tertiary or true lignite coal, *in situ*, about five or six miles from the base of the mountain. Other deposits of *lignite* may and can be found located irrespective of any general plan of deposition.

Hence, then, my assumption that anthracite coal can be found at Oakland, and I have added bituminous coal also; and what is much more, it will be more easily found, as its croppings will be much nearer the surface. Proof that it exists, then, presumptively, is to be found in the fact that bituminous coal of the very best quality, is to be found about seven miles southwesterly from the depot at Mayfield, on the San Jose Railroad, on the Martinez ranch. The coal crops out of the ground in regular veins, and is so hard and firm that notwithstanding its long continued exposure to the weather, a hard blow with a hammer is required to detach it. I think it is a cannel coal. I found immediately in the neighborhood of the coal a *macrocheilus*, and some other fossil shells, the name of which I have now forgotten, all belonging to the true bituminous series. Since then, the space between the Oakland and Santa Cruz mountains is a complete distinct geological basin, supposed to contain the three series of coal, and since the bituminous is found, as I have above pointed out, and the tertiary is to be seen on the shore, south of the Ocean House, which would be on a parallel line four to six miles further into the basin, and the anthracite to be sought west of the bituminous a mile nearer the mountains, but *where the lower rocks have been highly tilted* by traps, which would be in the mountains west of San Jose; therefore I infer that since Oakland is in this basin in which we positively know that there are two kinds of coal, and since we know by past explorations and observations that the sedimentary rocks underlie Oakland, San Antonio, and so on to Mission San Jose; and since we all admit that the layers of rock from side to side, of this and every geologic basin, is like putting saucers or oblong dishes one within the other; therefore if we find coal on one side of the basin we are fully warranted in the supposition and assertion that it will be found on the opposite side of the strata, and essentially undisturbed; and exploration will find it.

One great difficulty in the way of finding coal readily is in the fact that the rocks here are overlaid by tenacious diluvium, alluvium, and adobe soil. The bituminous coal, of which I have written, was overlaid by fifty feet, probably, of soft earth; but it is laid bare by the action of the water at the intersection of two ravines. Its presence would not otherwise have been suspected, but guided by these principles, systematic artesian boring would have found it. Here, then, we have a few facts and principles to guide us, and when our recognized scientific men shall have mastered somewhat of the mathematics of their business—instead of depending solely on fossils—which they can only do by diligently consulting Nature herself, there will be no difficulty in enlisting capital to aid in unearthing the treasures of our soil. When we can have cheap coal, which already lies at our front door, under the streets of Oakland, but not apprehended by her own people, then our manufactures of iron and cloth, and of every other description can be inaugurated, and a new impetus given to the material wealth and social prosperity of our State.

O. W. EASTON.

SALES OF THE WEEK

BY THE S. F. STOCK & EXCHANGE BOARD.

Saturday, March 17.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, March 24, 1866.

There contiaues to he a fair amount of husiness paper offering, hut the requirement fur hank eccommodatioa has nnt materially improved during tbe week. Large sums nf money heve, however, heen kept in mntion, partly for mercantile purposes, but chiefly for the uses ot tbe Stock market. These amounts simply pass from hauk to hank, or from one account to another ia tbe same bank; very little leaves the city; hut we learn that arrangements heve been perfected which will require large remittances to the interior at an early day for the development of miniag claims. There can be little doubt that a very active prosecution of miniag interests is contemplated the ensuing season, ead the condition of the Money Merkct favors it. The amount of capitel seeking investment, and no longer required for mercantile purposes, is considerehle, and eaterprises presenting a reasonable assurance of profit and safety, will probably experience less hindraace than heretofore for waat of fuads. The rate of discount still rules at 1@1¼ ₱ cent. per month in hank, and 1¼@1½ ₱ ccnt. in the open market.

Ia mortgage securities very little is doing at present, except by the Insurance companies and Sevings institutions, which have almost the monopoly of that business. The outside rate is 1 ₱ cent. per month upon city property.

Receipts of Bullion from domestic sources continue up to the usual average, and since Saturday last amounted to $900,000, making an aggregate of nearly *three millions* thus far during the current month.

The demand for bullion has not been active this week, and Gold Bars were taken to eccount hy Bankers and others within a range of 840@850. Silver Bars ruled et 1@1½ ₱ ceut. premium for average parcels.

Legal Tender Notes ere held with firmness nt enhanced rntes, and small sales were made at 76¼@78, closing at 78c hid, and 78¼c esked. The flattering condition of the National Treasury, and favorable legislation by Coagress looking to an immediate contraction of the currency, will, it is thought, still further reduce the premium on Gold Our latest telegraphic advices from the East quote Gold at about 128.

The Mining Share merket is heginning to attract much more attention. The unexpected rise a short time ago, and the firmness with which all stocks have heea maintained siace then, induces many parties to enter the exciting erena of tbe Stock Exchange who had no thought of ever doing so again. The increased productiveness of a number of prominent claims, and the promising character of recent developments in others, inspires more faith in their present and future value, and unless this confidence is soon rudely shaken hy some unfavornble circumstence or other, it will not be difficult tn revive, in some degree at least, the speculative spirit of formcr periods. It might he well, perhaps, to not attnch ea undue importence to the present appearances of the Comstock lode in different mines. The pesent experiences of silver mining in Neveda and in other localities are not without application nt this time. The fluctuating fortuues met with, and tbe difficulties encountered then, should not be lost sight of now.

Crown Point is in hetter favor, advaacing from $1,175 to $1,330, receding to $1,300, rellying to $1,350, then selling at $1430, and closing et $1440.

During the week ending the 16th instant, 608 tons of ore were extracted from the mine. The herren streak met with lnst week on the incline from the 300-feet level has given way to good ore. Ore is heing taken from the extreme west stratum (35 feet from main vein) worth $40 per ton. The lode on the 3d level has now been developed at lenst 200 feet iu length, verying ia width from 15 to 30 feet, and the prospect is feir for e further length of 200 feet. The main shaft is now down 50 feet, end in 30 days sufficient deptb will he attained for the new or 4th level. Receipts of Bullion for the first 15 days of this month emounted to $61,000, including some $3,600 from 12 tons of first-class ore.

Hale & Norcross has fluctuated but little, and is well maintained at the close, receding from $1,000 to $975, rising to $1,050, dropping to $1,007½, rallying to $1,027½, end then selling at $1,030@1,020. No material change has taken place in the general appearance of the lode in the 700-feet level, end the latest telegraphic advices are still favorable. The company heve now a surplus halance (over and above ell liabilities) of some $21,000, and tbis sum will be largely iucreased out of the earnings of the last half of this month.

Savage declined from $1,010 to $980, rose to $1,030, fell to $985, rallied to $1,020, buyer 30, end sold yesterday at $1,010@1,015. No ore has been extracted recently below the 2d level, but from this point up it is seid to hold out well, and shows a larger proportion of first-class. The new or 6th level will, it is thought, be opened on or ebout the 1st of April, the shaft now being down to the depth required. The company's mill is at present running by water-power, and crushing some 30 tons of ore per day at a low cost. Receipts of Bullion thus far, during the month, exceed $95,000.

Yellow Jacket has heen ia better request, and was actively dcalt in, advancing from $660 to $815, dropping to $785, rallying to $850, receding to $785, and selling yesterday at $750@800. During the week ending March 5th, 737 tons 2d-class and 302 tons 3d-class ore were extracted from the mine—the latter being sold at $3 per toa. The yield of Bullion from the compaay's mill during the same period emounted to $13,675.53. Thc new development met with in drifting from the south sbaft (lower level) is thought to he of some importance. The face of the drift shows good ore worth 35@40 per toa.

Ophir rose from $610 to $672½, buyer 30, fell to $600, rallied to $650, buyer 30, then sold et $640, and was dealt in yesterday at $665 @$725, some 275 feet in all changing hands. The general tenor of edvices, as to the real velue of the newly-discovered deposit in the 9th gallery, seems to he favorable. A winze is now being sunk on the east side of the vein, nnd the drift across the lode has met with a body of quartz some 18 feet west of the clay wall.

Chollar-Potosi has heen steadily meintained within a range of $385 @$400, closing at about $400. The Piute station has shown some improvement since last week. The upper stope of the Bajazette ground is turning out well, and some ore is still obtaincd from the lower stope. In the station 60 feet below the Potosi tunnel prospecting continues without eny ore being obtained. In the Choller there is no change to note. The new shaft is now down 585 feet, nnd the drift is underway agein. During the week ending March 16th, 1,094 tons of ore were sent to custom mills.

Alpha is inactive and dull, and small seles were made advancing from $305 to $320, dropping to $300, and closing at $305. Belcher rose from $275 to $300, fell to $285, rallied to $300, and sold yesterday at $315@325. There is no new leature to report in either of these two claims.

Empire Mill and Mining Compaay hes heen dealt in within a range of $205 and $195 per shere, closing at $202½ asked. Imperial is in less fevor, and more than 1,000 shares have changed hends; receding from $160 to $126, slightly rellying to $132½, end selling yesterday nt $138@137½. Receipts of hullion this month ere much lighter than usual, owing to tbe poverty of the ores reduced from both the Holmes and Alta mines.

Bullion is in hetter favor, steadily edvancing from $86 to $110, nnd selling yesterday et $110@130. Some favorable indications heve heen found this week in the lower drift east of the engine shaft. Overman is lower, dropping from $70 to $58, and closing at $65. Confidence fell from 72½ to $47, and sold yesterday at $52½.

The aggregate recorded sales of Stocks, since Saturday lest, amounted to $1,043,906,00.

The Best in America!

THE

Mining and Scientific Press,

Is the Largest and Best Mining and Mechanical Newspaper Issued in the United States.

DEWEY & CO.,

Patent Agents, Publishers, Book and Job Printers, **505 Clay street,** San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue embraces SIXTEEN PAGES of 64 columns, and furnishes more valuable reading matter than any other weekly journal in California.

To the practical mechanic, metallurgist, prospector, millman, mine holder or worker, it is worth many times the subscription price. Its files contain a record of the improvements in mining machinery, the process and development of the mines, and all new methods and processes for working and saving the precious metals—all progressive information, in fact, transpiring with the times—which cannot be obtained from books.

The MINING AND SCIENTIFIC PRESS is now in its TWELFTH VOLUME, and enjoys a large circulation. It received the following hearty endorsement of the California Miners' State Convention, held at Sacramento, January 17th, 1866:

RESOLVED, *That we regard a mining paper or journal of great importance to the mining interests of California, and recommend the* MINING AND SCIENTIFIC PRESS, *of San Francisco, to the consideration and support of the miners of the Pacific coast.*

Terms of Subscription.—One year, $5; six months, $3—in advance. Send for sample copies. Remittances may be made by mail at our risk, if parties sending will register their letters. AS AN ADVERTISING MEDIUM throughout the whole Pacific States and Territories, the PRESS is unsurpassed. Rates moderate.

OUR PATENT AGENCY

Is in most successful operation. We have had, proportionally, fewer rejections than any other agents during the past three years. *We can secure letters patent to inventors on the Pacific coast from 60 to 90 days sooner than they can be obtained through Eastern agencies.* By ready conference with us, our inventors will avoid all unfavorabilities, liabilities of misconceptions, and vexations and dangerous delays. We have an able and faithful assistant at Washington. We secure patents in all countries where patent laws exist. Our terms are as reasonable as any reliable agency in the United States. ☞ All communications treated with strict confidence. ☜ Circulars sent free.

BOOK AND JOB PRINTING.

Our facilities for doing good, rapid, and cheap printing are not surpassed in San Francisco. We employ none but the best workmen, and use our best efforts to please patrons, and advance their legitimate interests. The First Premium for Book and Newspaper Printing were awarded to Dewey & Co., by the Mechanics' Institute Industrial Exhibition, San Francisco, and the State Fair, Sacramento, in 1866.

Engraving, Electrotyping, and Stereotyping promptly attended to. Address,

DEWEY & CO.,

April 1st, 1866. San Francisco,

A. T. DEWEY, C. W. M. SMITH, W. B. EWER.

San Francisco Metal Market.

EXCELSIOR DOUBLE ACTING

Suction and Force Pump.

W. D. Hooker's Patent, August 15, 1865.

THE SUBSCRIBERS OFFER FOR SALE the following sizes of the above-named celebrated Pump, acknowledged to be the best Double Acting Pump known to be in use. They are more easily set in position, and are more durable and compact than any other Double Acting Force Pump; they are also worked with very little friction, and have greater forcing power than other pumps of like size. They are adapted to work by hand, wind-mill, horse, or steam power.

No. 1—Cylinder 2½ in., stroke 6 in.
No. 2—Cylinder 3 in., stroke 7 in.
No. 3—Cylinder 4 in., stroke 10 in.
No. 4—Cylinder 5 in., stroke 15 in.
No. 5—Cylinder 6 in., stroke 18 in.
The Nos. 4 and 5 are Mining Pumps.

We have also for sale a full assortment of Pump Fixtures, such as Iron Pipe, Hose, Brass Goods, etc.

J. W. BRITTAN & CO.,
12v12-3m 120 Front street.

MINING RECORD.

—AND—

INTELLIGENCE OFFICE.

We have established, in connection with this paper, a Mining Record and Scientific Intelligence Department, where persons desirous can obtain information with regard to any particular Mine or Mining District. All information already in our possession will be furnished free of expense, on application at this office.

CONSULTATIONS, ETC.

Being in direct and constant communication with the best and most experienced Metallurgists and Practical Chemists in the country, we are prepared to hold consultations and furnish advice on all matters relating to Metallurgy and the application of Chemistry to the Arts. Manufacturers and others about to enter upon branches of industry comparatively new or but imperfectly understood, will do well to call upon us for advice. When desired they will be put in communication with such persons as will be best able to give them the latest and most reliable information and assistance upon such matters as they desire to be informed upon. No charge will be made by us for any service we may render in such cases. When experiments are required, or valuable information is sought, which must be obtained from EXPERTS, we shall leave them to make their own pecuniary arrangements with parties to whom we may introduce them; it being our aim to merely bring them in contact with reliable men, so that they may thereby avoid the immense pecuniary losses which are so frequently incurred in this country by pretentious charlatans, who manage to ingratiate themselves into the favor of those who are seeking for information upon scientific matters, or intricate and not generally understood branches of business.

Persons about to erect furnaces for Metallurgical or other purposes; and who may themselves not be personally acquainted with the work in contemplation, will find it to their advantage to consult us previous to entering upon any such undertaking.

Questions by mail, accompanied by postage stamps, will receive due attention.

MINING EXAMINATIONS AND REPORTS.

Persons desirous of obtaining full and reliable reports upon Mines or Mining Properties; or Survey and Maps of the same, etc., will do well to make application for such service through the especial agency connected with this office.

ASSAYING.

All orders for assaying will be promptly and faithfully attended to. Orders from the mines especially solicited.

☞ All supposed new minerals or organic substances will be reported upon free of expense to such parties as will send the same to this office free of expense of transportation; and when proper and consistent with the wishes of parties interested, notices of the same will be given through the columns of the MINING AND SCIENTIFIC PRESS, and the contributions placed on exhibition in our cabinet.

Commencement of Twelfth Volume

— OF THE —

Mining and Scientific Press

Published Every Saturday.

The title of our journal is a truthful expression of its character.

It affords a class of progressive information to the Miners, Mechanics and Professional Men of the Pacific Coast, which cannot be derived from books, or other publications.

Each Volume comprises, in reality, a book of new intelligence and facts relating to Mining, Mechanism, Metallurgy, Science and Art, developed by our rich and peculiar resources, and identical with our own industry and history.

By the encouragement of intelligent economy in LABOR and GOLD-SAVING, we shall make the PRESS a source of INDIVIDUAL PROFIT to its patrons, as well as a public benefit to every local community to which it circulates.

The prospects of our journal are now brighter than at any former period. Our facilities for furnishing a valuable paper are constantly increasing.

Following are some of the many opinions generously expressed by our neighbors:

Editorial Expressions:

The publishers intend to make it the "Scientific American" of the Pacific Coast. Every miner should have a copy of it in his cabin, for it will be filled with useful information to the pick and shovel fraternity.—[Trinity Journal.

Should be taken by every man owning "feet" [and brains] in this State.—[Beacon.

In no other ten journals can the reader find the same amount of reliable mining news as in the PRESS.—[Contra Costa Gazette.

Every stockholder in different mines will find it will pay to take and read this mining journal.—[Contra Costa Gazette.

The PRESS is to the Pacific Coast what the "Scientific American" is on the Atlantic. It deserves its success.—[Aurora Daily Times.

It is fully up to the times, and furnishes the latest mining improvements and intelligence.—[Calaveras Chronicle.

Every miner should subscribe for the PRESS.—[Calaveras Chronicle.

It presents a channel through which all mining notices may be cheaply consolidated into one sheet for the convenience of all stockholders.—[Mountain Messenger.

We can give our testimony that it is always replete with useful and valuable information to miners and mechanics. [Placer Herald.

It contains correspondence from different sections, giving accounts of new discoveries in gold, silver and copper, and should be taken by every person that wishes to keep well posted on the developments of our State and the Territories.—[Mountain Messenger.

With the last number is an index to the whole volume, most useful and valuable to those who keep files of that paper.—[Shasta Courier.

Prof. J. D. Whitney's address on Mining, is given entire. * * * We preserve the PRESS, and would like to have a full file.—[Napa Reporter.

The public should support the enterprise of the MINING PRESS, one of the best papers in the State, by a liberal patronage, as it is only by a system of legitimate reports that our mines can be favorably brought before men of capital below.—[Calaveras Chronicle.

Under the management of Messrs. Dewey & Co., the PRESS has been much improved in every respect. * * It deserves a liberal support.—[Virginia Union.

A good paper for this country.—[Humboldt Register, Ne.

Those who would have a good paper of this character, should subscribe now.—[Marysville Appeal.

It embraces one of the finest fields in the world, and seems to improve it. * * * It will be second to no scientific record now published on this continent.—[Los Angeles News

A neat and useful journal. One of the most presentable and useful in the State.—[Sunday Mercury.

Such a journal has been needed on the Pacific Coast. The PRESS fills the bill.—[Reese River Reveille.

A splendid paper, and should have a good list of subscribers in prosperous Grass Valley.—[G. V. National.

We receive, regularly as clock work, this exceedingly valuable and interesting journal.—[Napa Reporter.

Interesting and important to miners and Mountain men. [Butte Record.

Friends pleased with our efforts in the publication of the PRESS can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

SUBSCRIPTION IN ADVANCE.

One Year, (two volumes) $5.00
Six Months, (one volume) 3.00

☞ BOUND VOLUMES FOR SALE. ☜

FOR ADVERTISING

Our terms are very reasonable. MINING COMPANIES are especially favored by our rates, and careful attention is given to the legal publication of MINING NOTICES.

OFFICE—No. 505 Clay street, corner of Sansome.

Mining Summary.

Most encouraging reports continue to reach us from all parts of the mines, and we may look for large receipts of the precious metals during the coming summer. The condition of the money market is especially favorable for an active prosecution of heavy mining operations, and large amounts of capital, both foreign and domestic, are seeking investment in that direction. We subjoin our usual summary:

CALIFORNIA.

Trinity.—William Roch, from Kellogg's Diggings, Hay Fork, informs the Trinity *Journal* that it has been a splendid working season, and that water for sluicing will last until August. The gold yield in that section will be large this year. This has undoubtedly been the most favorable mining season for most localities in this county ever known. From present appearances, water will be plenty everywhere until July.

Butte.—Many rich mines are now being developed in the vicinity of Forbestown, Butte county. The quartz ledges in that vicinity are proving to be immensely valuable, and the extent of that mining section is said to be equal to any other in California or the world.

Yuba.—The Templar Mining Company, No. 2, have let a contract for removing the Oregon City quartz mill from Oregon City, Butte county, to Indiana Ranch, in that county, to J. I. Johnson.

Nevada.—The discoveries of gold-bearing lodes in Nevada county, during the past two or three years, have been unparalleled in the history of California mining, and what is still better, there is no diminution or abatement of the good fortune attending the efforts of the "prospectors." Says the *Transcript* of the 20th: "Two more ledges were discovered and work commenced on them on Saturday last, at Willow Valley. The ledges are of good size, and the specimens brought into town showed considerable amount of free gold, with any amount of rich-looking sulphurets. Willow Valley is fast becoming one of the richest mining localities in the county."

The Star Spangled Banner mill was started upon the 13th inst. We learn from the *Gazette* that the mill is of ten stamps capacity. The machinery, including the engine, etc., was manufactured at the Miner's Foundry, San Francisco, and is said to be a model of perfection. It was put up under the direction of Mr. H. L. Hopkins, an experienced machinist. The mine has the reputation of being one of the best in the county, and it is said that the owners have refused $150,000 for the mine and machinery as it now stands.

The Cement Mines of this, as well as other portions of the State, are creating an unusual amount of attention. Of these mines in Nevada county, the *Transcript* speaks as follows:—

"The Blue Cement lead crosses Greenhorn from Bunker Hill to Hunt's Hill, and then runs parallel with the creek. It has been prospected as far as Jacobs & Sargent's Green Mountain claims. In many places, as in Carley & Tucker's claims, the top has been washed off by hydraulic mining, and the lead is for some distance laid bare. At other points it is worked by tunnels. The channel is from one hundred to three hundred feet wide, and extends entirely through Little York township to Gold Run, in Placer county. On this lead, within the past two years, some twelve or fifteen new mills have been built, and every week thousands of dollars are taken out, the proceeds varying from eight hundred to six thousand dollars to the mill. We do not know of a single company which has erected a mill and failed in getting good pay. A company near Yon Bet cleaned up their flume on Saturday, 13th inst., and got nearly $12,000 after ten days' run.

At Summit City, we learn that the Enterprise company has received all its machinery and will have the mill running by the second week in April. The only mill now at work is Winton, which is regularly employed crushing for the Pacific company. The rock pays $50 per ton.

Placer.—During last fall, says the *Herald*, quartz prospecting received quite a stimulus in the vicinity of Auburn and other mining localities of this section, from favorable discoveries made; but the wet winter checked operations to a considerable extent. Some companies, however, continued work, and at the present time, as appearances indicate that the protracted storms are over, we hear of very general preparations for renewing prospecting. We think more and better work will be done upon the quartz veins of this region, this summer, than ever before, and with results that will establish the character of our ledges as among the rich and reliable ones of the State.

New locations continue to be made, and we have lately been shown handsome gold bearing specimens taken from some of them near at hand.

The Auburn *Stars and Stripes* says that new and valuable quartz ledges are being discovered in that vicinity every day, and many old claims known to be good re-opened. All that is required to make this town equal to Grass Valley, is enterprise and capital. The laborers are plenty. Who will furnish the money to obtain the rich treasures hid in the ground all about us?

The Dardenelles company near Forest Hill cleaned 532 ounces of amalgam, on the 19th instant.

The Dewey claim, located at Bath, clean up from twelve to fourteen hundred dollars weekly, over and above expenses.

Several other claims in the above localities are doing equally as well.

A miner at Long Cañon, lately took out, after a run of five weeks, one hundred and sixty ounces.

Tuolumne.—The App mine, according to the Sonora *Democrat*, has been sold to a company of capitalists for $120,000.

Mariposa.—The Mariposa Mill commenced crushing rock on the 13th instant. The amount of rock to be reduced is about 300 tons, which will keep the mill running seven days. It is to be hoped that the rock will pay sufficient to warrant a continuance of work.

Sonoma.—The Marysville *Appeal* is informed that gold in paying quantities has been discovered in Sonoma county, about five miles south of Cloverdale, causing great excitement among the usually staid and steady farmers of that commonwealth. The gold is represented as being quite coarse, one nugget weighing five dollars.

The Healdsburg *Standard* says that the mines thereabout are about to form a company and go to work in earnest. Water is to be brought in by a ditch, and the entire surface worked for placer gold first; then the company intend prospecting for quartz. There is a large extent of country where good prospects may be found, but the difficulty of getting water on the ground will always prove a barrier to profitable mining on the range.

Los Angeles.—The Los Angeles *News* says that agents of capitalists are in that vicinity, with instructions to invest in any mines there that they have good reasons to think will pay for working. The *News* adds that there are many rich mines in our section, and all that is requisite to develop their hidden wealth is capital. Copper, silver and gold, besides other metals, are to be found in the three southern counties of Los Angeles, San Bernardino and San Diego, and in sufficient quantities to justify capitalists to invest their money to fully develop the mines. Our mineral wealth has received but a very small share of attention from those desiring to invest in mines—it was not far enough away from home. We trust reason is resuming sway—that common sense will be heeded. Los Angeles county can produce coal of a good quality, and a fine quality of marble. In fact, the vast resources of this county are yet undeveloped—capital is required.

ESMERALDA.

We condense the following from the Humboldt *Register*: "The Manitowoc continues to hammer out the bullion, though the workmen are at this time afoul of a *horn*, or barren spot.

W. K. Parkinson, Superintendent of the Silver Bullion Series has got his men to work on this mine. Better late than never, but the mine ought to have been turning out bullion long before this time.

The editor of the *Register* has seen a beautiful silver bar, the product of an even ton of quartz from the Empire claim, Sierra District. The company organized to work the Empire began the work of development under most flattering prospects. The claim is located on the Neptune Series, the group of ledges on which the Tallulah claims, a short distance further up the ridge. The Honey Lake claim lies between the Empire and the Tallulah, and the several ledges crop boldly in all three—thus evidencing true veins. The Empire company put down a shaft, and when satisfied of the reliable character of the ledges, commenced back in the cañon to run a tunnel. This tunnel is one of the best looking pieces of work in the county—five feet wide, seven feet high, and straight as a lead line. Thomas Ewing, owning largely in the claim, is trying to make arrangements for resuming work. At his own expense he took out this little batch of rock, to see what Torrey could make out of it at the mill. Blake & Co. melted and assayed it, and it turns out 135.45 ounces. Value, silver, $142.38; gold, $5.59—$147.97.

M. Milleson is back, after nearly two years absence from Humboldt. He comes out as agent for a New York company to direct work in several claims which Eastern capitalists have undertaken to develop.

The Esmeralda *Union* is informed that a New York company have purchased an interest in the Walker River mines, and are driving business along in a highly creditable manner. Parties lately from Walker Lake, report that the mines are looking well and they are to have a mill erected immediately, which will test the matter more thoroughly.

Wells, Fargo & Co., shipped from their office in this place, over three thousand dollars in bullion by the stage of the 16th inst., the greater portion of which was from Blind Springs.

The Antelope and Del Monte companies on the same day, paid $4,441 in greenbacks; delinquent taxes and costs. Of this amount, $3,871 were paid into the County Treasury.

The Kearsarge prospecting shaft is now 70 feet deep, and shows a continuous lode of mineral. There is ore enough in sight to pay expenses of working, and which is estimated to be worth $250 to $400 per ton. The Anglo Saxon looks well, as also does the Kenick. The Camanche still sustains its reputation, as well as the Dana.

The Sierra Blanche Silver Company's smelting works are completed, and will be in operation in a short time.

VIRGINIA CITY AND VICINITY.

A new mining district, known as St. Mary's, has recently been discovered, and is creating some excitement. It is on the Henness Pass road, about ten or fifteen miles from the junction of that road with the Donner Lake road. There will be a mill erected there this summer, and wood and water, the two great items of successful mining, are found there in abundance. The Silver Peak district is also creating some stir among the mining population, coal having been discovered, and good looking quartz in abundance. This district is located on the Truckee river, near Baurs' station, on the Donner Lake road.

The Gold Hill *News* says that nearly all the mills in that vicinity are now in full blast. There appears to be no scarcity of ore for crushing. Our bullion shipments prove this. The stamps clatter unceasingly—morning, noon and night the whistles scream, and everything is lovely.

The *Enterprise* says that the late strike in the ninth level of the Ophir is proving immensely valuable. The deposit of ore is now (in the bottom of the drift) 23 feet in width. For the first time in a long while we find the "dumps" of the Ophir filled with ore. Much credit is due to Mr. C. A. Luckhart, the engineer of the mine (mining engineer), for the discovery of this body of ore. We shall soon expect to see the Ophir hold its old place among the Washoe mines. About twenty tons per day of very rich ore is now being taken from the mines, and a much greater quantity will shortly be raised. Low grade ores are also being taken from some of the upper levels of the mine.

It is asserted by those capable of judging pretty correctly that the body of rich ore lately struck in the Ophir extends into the Central ground, and will be struck when the works of the company shall have been put down some thirty feet lower. It is thought that the deposit in the Central will be found to be from twenty-seven to thirty feet in width. It will be a big thing for the company as well as for the country.

Considerable interest is at present being manifested in the southwestern mineral fields of the State of Nevada. Many exceedingly rich veins have been discovered in that section. Generally the leads are but from two and a half to four feet in thickness, but as they are (where worth anything) a solid mass of pay ore, they can be profitably worked, as it costs nothing for timbering, and there is no waste rock to hoist out of the mine. The ores are generally chlorides, argentiferous galana and copper. Ores assaying from $100 to $400 ₱ ton are quite common. Mills are much needed.

A correspondent of the *Union*, writing from Partzwick, under date of March 10th, says that every day's work on the lodes of that section prove more and more conclusively the mineral wealth of that section of country. On the week previous, a specimen of seven pounds was brought down from Elmira, one of the Sierra Blanca company's mines, which looked so well that it was determined to send it to New York. It weighed 317 pounds, and will go to the Paris Exhibition, as the largest known specimen of silver ore ever found in that region of country.

Special School Notice.—J. C. Pelton, Superintendent of Public Schools, gives notice to parents and guardians who desire to have their children and wards enter the Public Schools, that they should make immediate application to the Principals of the several schools, and have the names of their children registered for admission. The Superintendent is determined that any child who desires, or who can be induced to accept, a seat in our Public Schools, shall be accommodated. If more seats are needed they will be promptly supplied.

[Written for the Mining and Scientific Press.]

Silver Mining in Placer County.

Sacramento, March 20, 1866.

Editors Mining and Scientific Press:—It is now an established fact that there are silver mines in California, which, if properly managed, will pay as well as those of Nevada, if not better, taking into consideration the expense of working, the expense of shipping machinery, of fuel and of labor, also the distance from market and transportation, all of which are cheaper and of easier access in California. Working rock, of the same quality in both places, pays better here. Now the question comes up, have we rock of the same quality here. The fact is well known to some that there is rock in Placer county that will range from $100 to $500 per ton, fire assay, both in the vicinity of Newcastle and Folsom. The silver leads at Newcastle were discovered by men who were working by night in the tunnel of the Kearsage Quartz Mining Company, and went prospecting in the day time. There are two ledges running parallel, northeast by southwest, and about two hundred feet apart.

The principal claims on those ledges are the Advalorem and Camanche on one, and the Pacific on the other. There is not much work being done on the Camanche at present, but on the Advalorem, near the line of the Camanche, that company are sinking a shaft, and have reached the depth of fifty-five feet, developing good ore, which, by roasting in a forge, will show globules of silver all over it. The Pacific company are down about forty feet, and have very good ore. Some ore from both claims has worked $64 per ton, mill process. Enclosed you will find a certificate from Mr. Waters, of Sacramento, of an assay made by him of ore from the Pacific ledge, at a depth of twenty-eight feet. The ledge is four feet and a-half wide, and shows some of the richest rock in this district, and the richest silver ore in the State. There is no mistake in regard to the quality of the ore; for by putting it into the forge it will, in a few minutes, run the silver out of the rock. The ledge has been visited by a great number of people, and all are satisfied that it is very rich in silver. The mines are one mile and a-half from Newcastle station, on the Central Pacific Railroad. There is a good wagon road from the station to the mines. Considerable stock has changed hands this week, selling readily at $3 per foot. I have sent you some of the rock from the Pacific, a portion of which is burnt, and some as it came from the mine. If you will examine the burnt rock with a glass you will find that the cavities are lined with silver. [We can see plenty of silver without the aid of a glass.—Eds. Press.] You will also find gold in the clear rock. From one piece I lost a large kernel of gold, but you can still see some gold on the rock. Eng.

The assay alluded to above is as follows:—Gold, 17 oz. to ton; Silver, 358 05-100 oz. to ton; value gold to ton, $3.51; value of silver to ton, $465.46; total value to ton, $468.97.

Waters & Co.

Sacramento, March 19, 1866.

A CHOICE ADVERTISING MEDIUM.

This week we issue an edition of 5,000 copies of the Youth's Companion, every copy of which will be thoroughly scanned by more than one pair of sharp little eyes, and the contents of every page, from first to last, will be re-uttered by many active, lively tongues in the presence of over 4,000 of the best families in this city and State.

Although we are receiving many additional subscribers to our list in response to the new enterprise in which we have engaged, we cannot expect, with the present high cost of printing paper, and our very low terms, to receive sufficient money from subscriptions alone to furnish as good a journal as we have determined to publish for our patrons; so we have widened the columns of the paper and adopted smaller type, which admits more letters in each line, and many more lines in each column of the paper, that we may have room for a few more select advertisements in the Companion *without decreasing in the least* any class of reading matter.

Our little journal circulates in more families than any other weekly published in San Francisco. No advertisements of the least objectionable character will be received, and as but a limited space will be devoted to this department, our young friends can safely inform their storekeepers, and other business acquaintances of these important facts for the benefit of the paper and all concerned.

Remember, only a few columns of our regular issue will be devoted to advertising, and the more profitable that class of patronage is made the greater will be the outlay upon our reading columns.

Dewey & Co., Publishers.

February 23d, 1866.

Familiar Lessons for our Young Readers.

PHILOSOPHY OF COMBUSTION AND OF BREATHING.

If a candle has been allowed to burn until it has a long snuff, on blowing it out with a sudden puff, a long, bright wreath of white smoke is observed to curl up from the hot wick; now if a lighted match is brought in contact with this smoke, even at a distance of two or three inches from the candle, the flame will suddenly run down the smoke and rekindle the wick in a very pretty and fantastic manner. We have often, in our boyhood days, performed this little experiment, and been much amused thereat, and added to the amusement of others in doing so. To be done nicely, there must be no doors open, so as to cause a current of air in the room, neither should there be any rustling about, near the candle for the same reason. Probably some of our young readers who have never heard it explained, would like to understand the philosophy of this little experiment.

The flame of a candle, on close examination, will be found to consist of three distinct parts or cones, the innermost one of which is quite dark, the next outer one being very luminous, while the third, or outermost one is darker than the middle one, though not quite so dark as that in the center. Now this center cone is made up of the very smoke which you see curling away, after the candle is blown out. It consists of the gas, which the heat evolves from the tallow or wax of the candle. This gas cannot burn until it gets far enough away from the wick to become mixed with the oxygen of the atmosphere.

It consists of hydrogen and carbon; the hydrogen is mostly consumed in the middle or most luminous part of the flame; the carbon, requiring a larger amount of oxygen for combustion, is not consumed until it reaches the outside of the flame, where it has free access to the air, and then burns with less intensity, and of course produces the less luminous though hottest part of the flame, which is observed on the outside.

When a large quantity of carbon is liberated by this inner flame, to be burned upon the outside, the candle or lump smokes. The smoke then given off is composed chiefly of very fine particles of carbon or coal, so fine that they float in the atmosphere, and form smoke. This smoke is black, and you cannot light it with the flame of a match, as you did the white smoke, which came from the extinguished wick. That white or light colored smoke was chiefly hydrogen, which is colorless, and contained just enough carbon to make it a little dark.

When you light a kerosene lamp it smokes, because the hydrogen given off burns more rapidly than the carbon. Now, to make the carbon burn as rapidly as the hydrogen, you must put the chimney on to create a greater draft, and thereby bring a sufficient quantity of oxygen in contact with the flame to burn the carbon, and then you have no smoke.

Now, notice another singular circumstance which occurs when you put the chimney on the lamp. You will see that it is almost instantaneously covered with tiny drops of water. Now some of our young readers may think this moisture is condensed from the atmosphere, as you will sometimes observe it on the panes of glass in the window, or on a pitcher of cold water when placed upon the table in a hot day. But it is not so.

There is a very pretty little experiment performed by this act of lighting a kerosene lamp. You know that water consists of hydrogen and oxygen, mixed in certain definite proportions. Now, you have hydrogen and carbon in your oil; you light your lamp, and the hydrogen of your oil is separated from the carbon by the heat you apply; the hydrogen unites with a certain portion of the oxygen of the atmosphere, and you then have hydrogen and oxygen in the exact proportion to form water—in fact, *you do form water*, and that is the water which is deposited on the inner side of your lamp chimney. It remains there until the glass becomes sufficiently hot to convert it into steam, when it passes off. Now, if your chimney was long enough to carry the products of your flame far enough to cool them, you would find *water* constantly trickling from your lamp chimney.

What becomes of the carbon, did you say? By putting on the chimney, and creating the extra draft we have spoken off, you bring sufficient oxygen in contact with the carbon to consume it—or, in other words, to unite every portion of it with the oxygen which the hydrogen has left—and this union produces carbonic acid gas, which is invisible, and very destructive to life. No animal can live in an atmosphere containing any large quantity of that gas. This gas is always produced where anything is burning. It is also produced in the act of breathing. We inhale atmospheric air, which, while in the lungs, suddenly undergoes a chemical change that converts a large portion of it into carbonic acid gas, in which condition it is exhaled. Hence the necessity of having all rooms in which a fire is burning, or a number of people are breathing, well ventilated.

To have a pure atmosphere, we must get rid of this carbonic acid gas as fast as it is formed.

It is the combination of the oxygen of the atmosphere with the carbon contained in the wood that produces the heat of the fire; there is a little hydrogen with the carbon to help it along, as we have already said. Now it is just the same thing—the combination of oxygen with carbon, that keeps up the heat of the body. We eat food, which consists chiefly of carbon; that food, or carbon, after being properly digested, is mainly taken up by the peculiar mechanism of the system, and goes to form bone, and fat, and muscle. Such parts of it as are not needed are passed off by various means—a portion passing into the blood gives it that black appearance, which forms such a marked difference between arterial and venous blood. This venous blood thus overcharged with carbon, is conducted into the lungs, where by an innumerable number of little cells, it is made to come in close contact with the atmosphere which we also draw into the lungs, in the act of breathing.

While the air is thus in close contact with the blood, separated only by a partition much thinner than the sheet of paper which you are reading, a chemical action takes place, by which the oxygen is made to take away the black-looking carbon from the blood; and when we throw out our breath we also throw out this carbon, in the form of carbonic acid, that is, carbon and oxygen united, the same way as it is when the carbon and oxygen is united in burning a candle or lamp, or a piece of coal or wood. It is this chemical action which is constantly going on in our systems, and particularly in the lungs, which keeps up the heat of our bodies, precisely as the heat of the fire is kept up. The difference is only in degree, that is, in proportion to the amount of carbon and oxygen which is brought into such intimate contact as to form a chemical union, and produce carbonic acid.

When you lean over your desks, or whenever you place your bodies in a stooping posture, you compress your lungs, so that you cannot take in sufficient air to furnish the oxygen required for taking away the carbon from the blood, and thus rendering it fit to sustain life; hence the blood remains bad, moves slowly through your veins, and the delicate little air cells of the lungs become irritated and inflamed, then a cough comes on, and finally the walls of the cells ulcerate and give way.

Now, boys and girls sit upright and stand up straight, so as to give the lungs plenty of fresh air at every breath, and you will never be in danger of consumption. Give your lungs a plenty of fresh air, and study will never hurt you, and you will find your heads all the clearer for it; also, you will be able to get your lessons easier. The warm blood will go coursing freely through your veins, imparting health and activity to your limbs, and redness to your cheeks.

The girls will find this same oxygen, of which I am talking, the best artist in the world to paint their cheeks. It never makes a mistake in the color; and if you let it have free access to your cheeks and lungs, it puts the color on so strong that you cannot wash it off."

SCHOOLS IN ESMERALDA.—We notice that the citizens of Aurora, Esmeralda county, one of the outposts of civilization on the Pacific coast, are taking an interest in their schools, and the cause of education generally. They have a flourishing Lyceum and Library Association, before which lectures are frequently delivered. We notice that our old friend, R. A. Ricker, Esq., one of the most enthusiastic and successful teachers on the coast, has a flourishing school in Aurora. Mr. R. recently delivered a lecture before the Lyceum, which is highly spoken of. His subject was "American Education."

ELECTROTYPE CUTS, ENGRAVINGS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State.

MINING AND SCIENTIFIC PRESS

PATENT AGENCY.

For the Pacific Coast.

OFFICE OF THE MINING AND SCIENTIFIC PRESS—No. 505 Clay street, corner of Sansome, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington.

The first question that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely consider his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch and description of the invention should be sent together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian, Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the following official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency or expense ensues. If the application is rejected we cause thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, our Washington agent has access to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorneys, upon the most moderate terms. Letters by draft in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimentions; it should be neatly made, of hard wood or metal, or both, varnished or polished; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & Co., Mining and Scientific Press, No. 505 Clay Street, corner of Sansome, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first instalment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way is to remit by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application prepared with names as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it be one of great complication; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance.

The following is the Government tariff of fees established by law:

On every application for a design, for 3 yrs and 6 mos	$10
On every application for a design, for seven years	15
On every application for a design, for fourteen years	30
On every application for a patent, for seventeen years	15
On every caveat	10
On issuing each original patent	20
On filing a disclaimer	10
On every application for a re-issue	30
On every additional patent granted on a re-issue	30
On every application for an extension	50
On the grant of every extension	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C.	25

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

N. B.—We make out our own forms for applications, etc., and would respectfully inform all parties that we have no printed blank forms for sale.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any article which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

Mr. Wm. R. Bradshaw, is our Special Correspondent and Traveling Agent. All favors or assistance rendered him in his progress through the country in behalf of our journal, will be duly acknowledged.

SAN FRANCISCO, Jan 1st, 1866.

Mr. A. C. Knox, is our fully authorized Traveling Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.

SAN FRANCISCO, Jan 11th, 1866.

Mr. Elwin Davis, is authorized to solicit subscriptions, advertising, etc., for the MINING AND SCIENTIFIC PRESS, in San Francisco, and to receipt for the same.

San Francisco:
Saturday Morning, Mar. 24, 1866.

Endorsement by the Miners' State Convention.

The following resolution was adopted by the California Miners' State Convention, held at Sacramento, Jan. 17th, 1866:

Resolved, That we regard a mining paper or journal of great importance to the mining interest of California, and we recommend the MINING AND SCIENTIFIC PRESS, of San Francisco, to the consideration and support of the miners of the Pacific coast.

THE MINER'S INCH OF WATER.

The unsettled state of the question of what should constitute a "miner's inch" of water has been productive of much controversy, and no little annoyance and loss to miners. Efforts have repeatedly been made to secure legislative action upon the subject, but hitherto without effect, and to the present day we have no law upon our Statute books regulating what shall constitute the miner's inch of water; the whole matter being left to the caprices of parties controlling the water. This miscellaneous and uncertain mode of measurement works great inconvenience and much positive loss, not only to the miners, but also to the manufacturer of mining machinery, who is often called upon to construct machinery, and make estimates founded upon quantities of water, the standard of which estimates vary with different localities.

The miner should have some law to protect him against the many contemptible tricks resorted to by ditch owners, in order to retard the quantity and flow of water which they are selling. It is well known to miners who have carefully studied the laws which govern the flow of water, that a wide margin is left for cheating in the delivery of the same; and none know better how to take advantage of these things than many of our ditch managers. Our experience in mining enables us to write advisedly of this matter.

In the absence of the necessary legislation, an effort was made during the Exhibition of the Mechanics' Institute in this city, in the summer of 1864, by persons here at the time, and interested in mining matters, to fix upon some standard of measurement which it was hoped might be generally acceptable. We are not aware to what extent that standard has been adopted; but we notice that Hon. Thos. Hansbrow, of the present Assembly, who took quite an interest in that effort, has now introduced a bill into the branch of the Legislature of which he is a member, making the standard adopted by the meeting at the Institute the legal standard for measurement. The bill, as introduced by Mr. Hansbrow, reads as follows:

SECTION 1. In all suits at law in the courts of this State where the question shall be involved, as to the quantity of running water sold, purchased, delivered or used, and described by "miner's inch," it shall be held and declared that a "miner's inch" of water shall consist of two and one-third cubic feet of water, passing a given point in one minute of time, or seven and $\frac{4064}{10000}$ gallons of water passing a given point in a minute; or one hundred and forty-five and $\frac{86}{100}$ pounds of water passing a given point in a minute.

The Committee on Mines and Mining Interests subsequently offered the following as a substitute for the above:

SECTION 1. A legal inch of water, sold for mining, agricultural, or other purposes, is hereby declared to be what water may pass through an orifice of one inch square, through plank of one inch in thickness, with a pressure of seven inches measured from the center of the orifice to the surface of the water; *provided* the water shall be delivered from a box in which the water has no motion except that caused by the flow of the water to be delivered from that particular box.

SEC. 2. This act shall take effect from and after the first day of May, A. D. eighteen hundred and sixty-six.

We presume the object of the substitute was to simplify the mode of measurement. That object is certainly accomplished, and the measurement is made so simple that the most ordinary mind can fully understand and apply it. Its simplicity is, certainly, much in its favor. But there are so many tricks and devices, well known to experienced miners and ditch men, to which ditch owners will sometimes have recourse, to falsify the more simple mode of measurement, that it is the opinion of many that the miner can be properly protected only by the absolutely correct and, consequently, more complex mode of measurement, proposed by Mr. Hansbrow.

AN ACT

To Secure the Miners of this State Pure and Unadulterated Quicksilver.

Introduced in the California State Senate, by Honorable DAVID BELDEN, of Nevada—Approved, 1866.

[ENACTING CLAUSE.]

SECTION 1. Every company or person within this State engaged in the production of quicksilver by mining, for the purposes of sale, and every firm, company or person, importing into this State quicksilver for the purpose of sale, shall cause to be prepared a metallic stamp of such form and character as may enable such company or person to impress upon wax or other plastic material the seal hereinafter provided. Such stamp shall be so constructed, that either by characters engraved upon the same, or moveable types and dies connected therewith, there may be impressed a seal, showing—

1st. The name of the company, firm, or person producing or importing the quicksilver.

2d. The date at which such seal is applied to each tank or vessel of quicksilver.

3d. The amount of quicksilver contained in such tank or vessel.

SEC. 2. Before any tank of quicksilver shall leave the works of any mining company engaged in the production of the same for sale, or the warehouse of any firm or person importing such quicksilver for sale, such company, firm, or person shall cause a seal of wax, or other plastic material adapted to the purpose, to be applied to the top, plug, or orifice through which such tank is filled, and in such manner that such tap or plug cannot be removed or disturbed, or such orifice opened without breaking or displacing such seal. Such seal, when thus applied, shall be impressed with the stamp above, provided in such manner that such seal shall exhibit plainly all the characters required of such stamp.

SEC. 3. Any person who shall forge or falsely fabricate the stamp or seal of any firm or person, as herein provided, or attach the same to any tank or vessel of quicksilver, shall be deemed guilty of forgery, and upon conviction, shall be punished by imprisonment in the State Prison for the period of not less than one nor more than five years.

SEC. 4. Any person who shall willfully and knowingly adulterate and debase any quicksilver assigned for sale, or that may thereafter be offered for sale, by mixing with such quicksilver any lead, antimony, or other base metal, shall be deemed guilty of a misdemeanor, and upon conviction, shall be fined in a sum not exceeding one thousand dollars, or imprisonment in the County Jail not exceeding one year, or both such fine and imprisonment.

SEC. 5. Any vendor of quicksilver who shall vend or sell to any person any quicksilver debased or adulterated by mixture with the same of any lead, antimony, or any other base metal, shall be liable to the purchaser of such quicksilver for all the damages and injury sustained from such debasement to be recovered by such purchaser in a civil action. And such damages, when ascertained by the Court or Jury, shall be at once quadrupled by the Court or by the Clerk, by order of the Court, and judgment for four times the damages proven shall be entered in favor of the plaintiff, and against such defendant; provided, that nothing contained in this section shall be taken to apply to any person selling quicksilver that has already been employed in mining or the mechanical arts, and who, when selling the same, shall state to the purchaser that such quicksilver has been thus employed.

NEW SUPERINTENDENT.—Capt. A. De Shields has been appointed Superintendent of the Gould & Curry mill, in the place of Mr. J. P. Edwards, resigned. Capt. De Shields is said to be well qualified to fill the position to which he has been appointed, having had much experience in working ores, and being perfectly familiar with every department of the company's mill.

THE proprietors of the London *Times* found their profits so large at the end of 1865, that they made every man in the office a present of two weeks' additional salary.

THE LOCATION AND POSSESSION OF MINING CLAIMS.

EDITORS MINING AND SCIENTIFIC PRESS: Believing you to be conversant with matters pertaining to mining interests, the manner of making locations, etc., I have taken the liberty of asking you a few questions in regard to the way locations are made in different mining camps. First.—Can a company locate a claim square, and hold all the ledges and minerals within said square? and, if so, how are locations of that kind made? Second.—Can a company holding a square location follow the dips, spurs and angles of their ledge or ledges into the grounds of other locations laying along side? Third.—How does a location made to hold a ledge differ from a square location. By answering the above questions through your valuable paper you will confer a favor upon many who are not posted.

Respectfully yours,

A MINER.

Stockton, March 5th, 1866.

1st. The location of a square claim holds all the ledges, minerals, and everything else within the lines of the square, perpendicularly, downwards.

2d. A company locating a square claim cannot follow the dips or angles of any ledge or mineral after it dips from their own into the ground of another claim.

3d. A "location made to hold a ledge" is supposed to be made along the line of such ledge, following all its turns and angles upon the surface, and its dips and spurs beneath the surface. It differs from a "square" location in the fact that it does thus follow the ledge, and is not confined in its depths to the perpendicular lines descending from the surface boundaries of the claim.

The Legislature of Nevada, at its late session, passed an act regulating the location and possession of mining claims for that State, which we intend to publish. The Territorial Legislature of Arizona has also passed a similar law, which was published in our issue of December 24th, 1864. With these exceptions, we believe no other State or Territory has enacted any such law. In all other States and Territories the miners in the different localities make such laws as may suit themselves, and the Courts, both State and National, respect these laws.

In new and distant localities, where no law exists, all that is necessary is for public notice to be given, calling a meeting of miners to organize a district, within certain stated boundaries, and enact suitable laws for the same. Any number who may be present at such meeting, so called, will be competent to act, and their action will be respected in all the Courts. A recorder, of course, should be appointed, who should make and keep a proper record of the first and all subsequent meetings, and properly record all claims which may be located.

NEW BOOK.

A GENERAL DIRECTORY AND BUSINESS GUIDE of the Principal Towns in the Upper Country, embracing a portion of California; together with Mining and Statistical Information concerning Idaho Territory, and a Map of Idaho and Montana."

We have received a copy of the above work, whose general character is sufficiently indicated by its title, forms a neat volume of about 160 pages. The "Business Directory" contains the address of firms in all the more important towns of Oregon, and of Washington and Idaho Territories, as well as in those places of California whose situation and business relations connect them with the "Upper Country." The map is well executed, and besides Idaho and Montana, it represents in outline, Oregon, and Washington Territory, together with the northern portions of California, Nevada and Wyoming, and shows the principal routes to the new mining regions.

The part devoted to mining and statistical information is quite full, giving brief descriptions of the quartz mills, and more important mines in each district, lists of locations already recorded, with the number of feet they contain, data respecting population, table of distances, etc., etc. We recommend the book to those having business relations with the "Upper Country."

[Translated and collated for the Mining and Scientific Press, by Dr. Lanszwert.]

The Transmutation of Metals---Singular Developments.

At the present time the term Alchemist is merely synonomous with "fool;" although in the dark ages it was a title of dignity given to the adepts in the mystical art, who sought by its aid to discover the "philosopher's stone," whereby they might transmute the base metals into gold, and prepare the "Elixir of Life." We say avarice, fraud, and folly were their motives, yet these ephemeral researches were instrumental, to an important extent, in the progress of the chemical art.

Balzac, to throw ridicule upon an unappreciated *savant*, remarked that "he is trying to make gold;" and George Sand compares the physiognomy of an indefatigable prospector to that of an alchemist, lost in the research of the absolute. Was it to that end that such men as Rhases, Avicenne, Bacon, Albert the Great, Raymond Lulle, Nicholas Famel, Paracelsus, and many others, have expended their lives over their crucibles and retorts.

The transmutation of metals was, in the middle ages, perfectly in accordance with the science of the day, and was not then in opposition to any known principle, but did have absolute facts for a starting point. They were simply misunderstood. It is true that among the adepts of alchemy there were quacks and fools who pursued the most ridiculous manipulations. Some heated mercury in close vessels during consecutive years, or indulged in the hope that by certain combinations of salts, gold could be obtained; others, through imposture, ventured even to deceive the public by pretended manipulations.

Among the arts of life some appear to possess a progressive character, while it is in the nature of others to be comparatively stationary. Take artificial illumination as an example of the former; its history belongs to all stages of human progress; it commences with the murky glow of the fire-brand, and step by step, slowly, surely it advances, until in the modern magneto-electric machine of Faraday, we are enabled to grind out an artificial sun-light, and compute it by horse-power standard Between these two extremes, the fire-braud, fit type of the dark ages, and the dazzling magneto-electric light, emblem of modern science, there are all intermediate phases of progress; and beyond the modern refined methods of illumination the improvements which may in the future take place are beyond prediction. Compare with this, for a familiar and somewhat parallel instance, the art of catching fish; compare the modern nets and hooks with those of the past ages—compare the harpoons, spears, and creels of civilized people with the contrivances of the African and other savages. If this be done it will be seen, we opine, that there is something belonging to the nature of practice itself, which relies upon simple methods, such as must soon be arrived at, and which once in practice have not the expansibility or property of growth belonging to instances of the first class. This view, as we have put it, is, we are aware, true in a degree only; but, accepted with caution, it will be found, we believe, in a multitude of instances, and, in the main, correct. The art of extracting gold from its matrices is, possibly, of a character intermediate between the two extremes above instanced. It affects simplicity, and certainly has progressed but little. The fleece sunk in Pactoleon streams by the shepherds of the old world, and thus gradually becoming golden, is represented by the druggets and blanketings of the quartz mills of the present day. The stamper is a hammer. The Chilian mill a pestle and a mortar; the amalgamating barrel, a churn. All these are indeed improvements for the mechanical extraction of gold from the rock; but inventions for gold extraction may be of a chemical nature. Let us consider how far we may indulge our hopes in this direction. We have heard of *fusion processes*. There was Longmaid's, and many other propositions of this nature, all of which have sunk into calm repose. There was an American invention, in which the quartz was to be admirably dissolved in a caustic solution, under pressure, and the gold, however finely divided, was to subside through the gelatinous mass; all this was to take place, and more than all this. The waste of the process was to supply, somehow, the refined productions of the ceramic art; it was to be stained and dyed with all the brilliant tints of the rainbow, and was to be consolidated into

blocks suitable for new and gorgeous styles of architecture. Our houses were to be translucent palaces of lapis, opal, and jaspar. Does not this sound as if we were ourselves romancing, and yet in truth we are but narrating a very mild edition of the announcement. Besides this there was a chlorine process, in which all former chemical experience was adroitly set at fault. These are instances of propositions for chemical processes, and they tend to show how small a progress has been hitherto made in adapting the processes of the chemist to the extraction of gold on the grand scale.

A few years since a famous professor of the University of Hall, named Semler, announced that he had discovered the *grand secret*. The Academy of Berlin indeed found in the retorts of the chemist the presence of gold, but a few days after it was discovered that his wife, to flatter his mania, had put gold leaf into his apparatus. Some years after, a similar deception was practiced in England. Dr. Price executed several times, in public, the transformation of mercury into silver and into gold, by the addition of a little *powder*. The Royal Society of London, of which Dr. Price was one of the most distinguished members, being impressed with the effect of these reported experiments, appointed an investigating committee to verify the fact. Price then pretended that he had no more *powder*; but, being put to the wall, he gave to his comedy a terrible and unexpected denouement by poisoning himself with prussic acid.

Although these unsuccessful attempts ought to give the last grace to alchemy, others came forward which seemed to confirm the possibility of the transmutation of metals.

Thus Van Helmont relates that, in 1518, he received a quarter of a grain of a substance by which he converted eight ounces of mercury into pure gold. Helvetius, physician to the Prince of Orange, claimed to have obtained the same result; and the Count de Reuss transformed, in the presence of the Emperor Ferdinand III., two pounds and a-half of mercury into fine gold by one grain of a *red* powder. With this gold a commemorative medal was struck, which could be seen as late as 1787, at the Treasury Department at Vienna.

At the present time the "secret art" and the researches of the middle ages are held in less derision than formerly. The phenomena of allotropism and isomerism sustain the opinions of Bacon, Verulam, Spinoza, Leibnitz, and Sir Humphrey Davy, who as the priests of Hermes, believed in the philosopher's stone, and in the transmutation of metals. Many of our readers will be astonished to learn that two of the most illustrious chemists of the present day, M.M. Dumas and Berthelot, entertain the same opinion.

A few months ago, Berthelot, in a lecture at the College of France, expressed himself as follows: "The synthesis tends to the demonstration of this capital truth, that the chemical forces which govern organic [inorganic?] matter are really, and without reserve, the same which govern animal matter."

M. Dumas gives, in his excellent lessons on philosophical chemistry, the following significant words: "Is it possible to admit simple bodies to be isomeric? This question touches closely that of the transmutation of metals. Affirmatively answered it would imply chances of success in the search for the philosopher's stone. We must then consult experience, and experience, it must be confessed, is not as yet opposed to the possibility of the transmutation of elementary substances. On the contrary, it even argues against our repulsing this idea as one which is demonstrated by the present state of our knowledge to be an absurdity.

The question of the transmutation of metals has recently made a new advance, thanks to the learned researches of Dr. Henry Favre, and of M. Franz, the metallurgist, of Paris. The possibility of transforming silver, copper, and mercury into gold, announced by them, has strongly attracted the public attention. Nevertheless, in making their discovery public, the object of the inventors has been less to prove that they have succeeded in making gold, than to demonstrate the *essential instability* of elementary substances, the importance of which fact, in the scientific world, is very great.

All substances in nature owe their respective properties only to the fixation of forces, which have passed, for the time being, into a static condition, but which are always capable of being called forth into a state of free activity. All these substances, then, according to M.M. Favre and Franz, should be regarded as produced by the operation of one and the same common and original principle. It does not follow, however, that the metals are composed of still simpler elementary bodies, which, by their intimate union, have hitherto escaped the means of analysis. They should rather be considered as simple in a chemical sense, but as composite in a dynamico-static sense. This principle once admitted, it was easy to determine the experiments that should be made, and which have been made accordingly. Among these we will here record but one—the third. It is so simple, quickly performed, and will, we think, be perfectly intelligible to our readers.

A certain quantity of chlorhydrate of ammonia (sal ammoniac) is dissolved in ammonia. The salt should be well pulverized. This solution is filtered if it is turbid. Chloride of silver, still damp and perfectly white, is then added to it, and the flask is shaken. The chloride of silver dissolves, and the liquor immediately becomes turbid, assuming at the same time a yellow color. Upon resting a while, a yellow powder is deposited, which is collected with care. The following are the characteristics of this powder:—

1. Treated with aqua regia, it dissolves completely, and a new addition of ammonia re-precipitates it.
2. It is not fulminating.
3. It furnishes gold by electrolysis, that is, at the two poles of an element of Bunsen.

It will be seen that there is here produced a most remarkable fact; that is, a transformation and a separation simultaneously. The ammonia is the solvent of the chloride of silver, and at the same time the reagent of the metal transformed by the chlorine.

It results from the experiments of M.M. Favre and Franz that the transformation of silver into gold takes place in two distinct stages or phases. The first has for its object the change of condition of the silver, which does not yet, however, constitute gold. The second has for its object and result the change of this new indeterminate body into the definite condition of fine gold.

Such a subject deserves, perhaps, to be treated more in detail; but we shall return to it when M. M. Favre and Franz shall have published their proceedings relative to the transformation of copper and mercury into gold. The question is well worth the trouble.

Important to Secretaries.

The following Act (introduced by Senator ROBINSON) has been passed by both branches of the Legislature, and will take effect immediately upon the approval of the Executive:

AN ACT CONCERNING ASSESSMENTS UPON THE STOCK OF CORPORATIONS.

The People of the State of California, represented in Senate and Assembly, do enact as follows:

SECTION 1. The Trustees of any corporation, formed under the general laws of this State, shall have power to levy and collect, for the purpose of paying the proper and legal expenses of such corporation, assessments upon the capital stock thereof, in the manner and form and to the extent hereinafter provided, and not otherwise.

SEC. 2. No one assessment shall exceed five per cent. of the stated amount of the capital stock of the corporation, named in the articles of incorporation, and none shall be levied while any portion of any previous assessment shall remain unpaid, or uncollected, except in cases where all the powers of the corporation shall have been exercised in accordance with the terms of this act, for the purpose of collecting such previous assessment, and except, also, the collection of a previous assessment against one or more stockholders, restrained by injunction or otherwise; in which case, further assessment may be levied and collected according to this act.

SEC. 3. No assessment shall be levied except by order of the Board of Trustees, concurred in by a majority of said Board, and entered upon the records of the corporation.

SEC. 4. Every order levying an assessment shall specify the amount thereof and the time when the person or persons to whom and the place or places where the same is payable. It shall also appoint a day subsequent to the full term of publication of the assessment notice on which the stock upon which assessments remain unpaid shall be deemed delinquent, which said day shall not be less than thirty, nor more than sixty days, from the time of the making of the said order levying the assessment, and a day for the sale of delinquent stock, which shall not be less than fifteen, nor more than sixty days from the time appointed for declaring said stock delinquent.

SEC. 5. Upon the making of such an order, the Secretary shall cause to be published immediately a notice thereof in the following form:

"[Name in full.] [Location of works.] Notice is hereby given that at a meeting of the Trustees of said Company, held on the [date], an assessment of [amount] per share was levied upon the capital stock of said Company, payable [when, to whom, and where, particularly]. Any stock upon which said assessment shall remain unpaid on the [day fixed] shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on the [day appointed], to pay the delinquent assessment, together with costs of advertising and expenses of the sale. [Signature of the Secretary, with particular location of office.]"

SEC. 6. Said notice shall be published once each week for four successive weeks in some daily or weekly paper published at the place designated in the articles of corporation as the principal place of business of the corporation, and also in some paper published in the county in which the works of the corporation are situated, if a paper be published therein: *provided*, that if the works of the corporation are not situated within some State or Territory of the United States, then publication in a paper of the County shall not be necessary; *provided, also*, that if there is no newspaper published at the place designated as the principal place of business of the corporation, then the publication shall be made in the newspaper published nearest thereto; and *provided, also*, that the notice specified in the 5th section of this act may be served by delivering a copy thereof, certified by the Secretary, to each stockholder personally, and in case of such service upon all the stockholders of said corporation, then no notice by publication shall be necessary, and such personal notice shall be deemed complete.

SEC. 7. If any portion of the assessment mentioned in said notice shall remain unpaid on the day specified therein for declaring the stock delinquent, the secretary shall, unless otherwise ordered by the Board of Trustees, cause to be published in the same papers in which the notice provided for in Sec. 5 shall have been published, a notice substantially in the following form:

"[Name in full. Location of works.] *Notice.*—There is delinquent upon the following described stock, on account of assessment levied on the [date,] [and assessments levied previous thereto, if any,] the several amounts set opposite the names of the respective shareholders, as follows: [Names, number of certificate, number of shares, amount.] And in accordance with law, [and an order of the Board of Trustees, made on the [date,] if any such order shall have been made,] so many shares of each parcel of said stock as may be necessary, will be sold at the [particular place,] on the [date] at [the hour] of said day, to pay said delinquent assessments thereon, together with costs of advertising and expenses of the sale. [Name of Secretary, with particular location of office.]

SEC. 8. Said last named notice shall state every certificate of stock with the number of shares which it represents, and the amount due thereon, separately, except where certificates may not have been issued to parties entitled thereto, in which case the number of shares and amount due thereon, together with the fact that the certificates for such shares have not been issued shall be stated.

SEC. 9. Said notice, when published in a daily or weekly paper, or in both, shall be published as follows: When published in a daily paper, the same shall be published for a period of ten days, excluding Sundays and holidays, previous to the day of sale. When published in a weekly paper, the same shall be published for two weeks previous to the day of sale. The first publication of all delinquent sales shall be at least fifteen days prior to the day of sale.

SEC. 10. By the publication of the said notices, as hereinbefore provided, the corporation shall acquire jurisdiction to sell and convey a full, complete, perfect, and absolute title to all of the stock described in the notice of sale upon which any portion of the assessment or costs of advertising shall remain unpaid at the hour appointed for the sale, but shall sell no more of such stock than is necessary to pay the assessments due and cost of sale.

SEC. 11. On the day and at the place, and as nearly as may be at the hour appointed in the notice of sale, the Secretary, who is hereby fully empowered and authorized, shall, unless otherwise ordered by the Board of Trustees, sell, or cause to be sold at public auction, to the highest bidder for cash, so many shares of each parcel of said described stock as may be necessary to pay the assessment and charges thereon, according to the terms of said notice of sale; *provided*, that if payment be made before the time fixed for sale, the party paying shall only be required to pay the actual cost of advertising.

SEC. 12. The person offering at such sale to pay the assessment and costs for the smallest number of shares, or fraction of a share, shall be deemed the highest bidder.

SEC. 13. If, at the sale of any stock under the foregoing provisions of this Act, no bidder shall offer to take and purchase the same for the amount of the assessments, and costs and charges then due upon the same, then and in such case the same may be purchased and bid in by the company or corporation, through the Secretary or President, or any Director or Trustee thereof, at a sum equal to the amount of the assessments, costs, and charges due upon the same; and in pursuance and by virtue of such purchase, the said assessments, costs and charges, shall be credited, as satisfied and paid in full, on the books of such corporation, and entry of the transfer of such stock to such corporation, in pursuance of such sale and purchase, shall be made on the books of said corporation. While such stock shall remain the property of such corporation, the same shall not be assessable, nor shall any dividends be declared upon the same; but all assessments and dividends shall be apportioned upon and against the other stock of such company not owned by such corporation. All purchases of its own stock made by any corporation, in accordance with the provisions of this section, shall be held valid, and as vesting the legal title to the same in said corporation; and the stock so purchased shall be held subject to the control of the remaining stockholders, who may make such disposition of the same as they may deem fit, in accordance with the by-laws of the corporation or vote of a majority of all the remaining shares. Whenever any portion of the capital stock of any corporation is held by the said incorporation by purchase as aforesaid, a majority of the remaining shares of stock in said corporation shall be held to be a majority of the shares of the stock in said corporate company for all purpose of election or voting on any question before a stockholders' meeting.

SEC. 14. The times or dates fixed in any notice of assessment or notice of delinquent sale, published according to the provisions of this act, may be once extended for a period of not more than thirty days, by order of the Board of Trustees, duly made and entered on the records of the corporation, but no order for extending the time for the performance of any act specified in any notice shall be effectual unless notice of such extension or postponement be appended to and published with the notice to which [the] order relates.

SEC. 15. No assessment duly levied shall be rendered invalid by a failure to make proper publication of the notices hereinbefore provided for, nor by the non-performance of any act required to be performed in order to enforce the payment of the same; but in case of any substantial error or omission in the course of proceedings for collection, all previous proceedings, except the levying of the assessment, shall be void, and publication shall be begun anew.

SEC. 16. No action shall be sustained to recover any stock, or invalidate the sale of any stock for delinquent assessments, upon the ground of any irregularity in making the assessment, or for any irregularity in or defect of the notice of such sale, or for any defect or irregularity in the sale, unless the party seeking to maintain such action shall first pay or tender *to the corporation or the party holding such stock so sold*, the sum for which the same was sold, together with all subsequent assessments which may have been paid thereon, and interest on such sums from the time they were paid; and no such action shall be sustained unless the same shall be commenced by the filing of a complaint and the issuance of a summons thereon within six months after such sale shall have been made.

SEC. 17. "An Act Concerning Assessments upon the Stock of Corporations," approved April 4th, 1864, and all Acts and parts of Acts, inconsistent with the provisions of this Act, are hereby repealed; *provided*, that such repeal shall not affect proceedings commenced for the collection of assessments heretofore levied, but all such assessments may be collected in accordance with the provisions of the laws then in force.

SEC. 18. This Act shall take effect immediately.

THE USE OF SODIUM.—The *Alta* of this city, in noticing the experiments of Professor Silliman in the use of sodium, which we gave at length three weeks ago, adds the following confirmatory evidence:

We add to the opinion of Professor Silliman the experience of R. B. Gray & Co., manufacturing goldsmiths of this city. They have been in the habit of reducing the "sweeps"—that is the sweepings and refuse of their establishment—into which considerable quantities of the precious metals find their way, and at the last reduction, after the sweeps had been put through the regular process, and were ready to be thrown away, according to custom, an experiment was tried by working them over again with sodium. The result was that nearly as much gold was obtained from the second process as from the first. This work was done in a Knox amalgamating pan. It will be observed that these experiments relate only to the amalgamation of gold. Mr. Kustel, one of our most competent metallurgists, has given it as his opinion that no plan has yet been devised for using sodium to advantage in silver mining.

THE guards on the trains on the Swedish railways are required to have a knowledge of the elements of surgery, that in case of accidents they may be able to render medical assistance. An ambulance, fitted up with every requisite, forms a part of each train.

MONEY BY MAIL.—Subscribers and advertisers remitting us money in less sums than $50, can do so by mail at our risk, if they will register their letters; we will take no risk on unregistered letters, or letters by express. Remittances by express must be prepaid.

WHY CHILDREN DIE.—The reason why children die is because they are not taken care of. From the day of their birth they are stuffed with food, choked with physic, suffocated in hot rooms, steamed in bed clothes. So much for in-doors. When permitted to breathe a breath of air once in a summer, and once or twice in the coldest months, only the DOSE is permitted to peer into daylight. Bare legs, bare arms, bare necks, girted middles, with an inverted umbrella to collect the air and chill the other parts of the body. A stout, strong man goes out ON a cold day with gloves and overcoat, woollen stockings, and thick, double-soled shoes. The same day a child of three years old, an infant in flesh and blood, and bone and constitution, goes out with soles as thin as paper, cotton socks, legs uncovered to the knees, neck bare; an exposure which would disable the nurse, kill the mother in a fortnight, and make the father an invalid for weeks. And why? To harden them to a mode of dress which they are never expected to practice.

Trades and Manufactures.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

Metallurgy.

MOSHEIMER'S CONCENTRATOR

RECEIVED THE FIRST PREMIUM

From the ROYAL POLYTECHNIC SOCIETY, in Cornwall, and was highly recommended by the Commissioners as the most Simple and Effective Concentrator for all kinds of Ores.

Every Quartz Mill ought to have them, as they not only save Gold and Silver, but also the Quicksilver and Sulphurets, without extra labor. They can be built entirely of wood at the mine, and will separate more perfectly in one operation, than any other Concentrator in use. Apply to

J. MOSHEIMER,

EUROPEAN

METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

BY MAIL.—The MINING AND SCIENTIFIC PRESS will be sent by mail to any part of the civilized world. In case of removal, subscribers have only to inform us of the post-office address of their old and new location, and the paper will be sent accordingly.

SEND US WORD.—If any subscriber to this journal fails to receive the same regularly and promptly, they will confer a favor by informing us at once.

The Adrian (Michigan) *Expositor* relates the following incident:

"A little girl about two years old and a diminutive little thing at that, while playing with her brother, by some unaccountable accident, fell into a well about thirty feet to the water. The bucket was down (it probably went down with the child), and the mother, instead of wasting her energies in fruitless screams, caught the rope and swung the bucket partially under the child; the little hands grasped the pail, and it was drawn to the top and rescued by the terrified but courageous parent. During its perilous journey out, it looked up and several times called 'mamma.' A more thrilling peril and rescue seldom occurs, and indeed, the whole thing is next to miraculous; but the facts are beyond cavil."

New School-House in Stockton.—A contract has been let for building a new school-house for the North District School of Stockton. The size of the building is twenty-six by forty feet, and one story of sixteen feet in hight. The design is very neat, and when the house is finished according to contract, it will be one of the finest in that part of the State.

'What is wanting,' said Napoleon one day to Madam Campan, 'in order that the youth of France be well educated?' 'Good mothers,' was the reply. The Emperor was most forcibly struck with this answer. 'Here,' said he, is a system in one word.'

A Business Compliment.

Petaluma, Oct. 4, 1865.

Messrs. Dewey & Co.—Gentlemen: Your note informing me that my patent for Crushing and Baling Machine is ordered to issue is at hand. Please accept my thanks for the prompt and business like manner with which the case has been conducted, and inclosed find twenty dollars for balance Government fees. Respectfully, etc.

JACOB PRICE.

1852 1866

A NEW VOLUME.

Fourteenth Year of Publication.

THE GOLDEN ERA.

FOUNDED IN 1852.

The oldest weekly paper in the State, permanently established, and more widely circulated at home and abroad, than any other paper on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents and contributors of distinguished ability in New York, Paris and London.

Miss BRADDON'S greatest Sensation Story, published from advance sheets:

RUPERT GODWIN;

—OR—

THE SECRET OF WILMINDON HALL.

A NOVEL.—BY MISS M. E. BRADDON,

Author of "Lady Audley's Secret," "The Outcasts," "The Doctor's Wife," "Three Times Dead," etc.

—IN—

THE GOLDEN ERA.

NOW IS THE TIME TO SUBSCRIBE!

Opinions of the Press:

THE GOLDEN ERA.—We would call the attention of all newly-arrived Californians to this excellent weekly colemporary. We have seen the Era so frequently at the family fireside, and in the rude cabins of many industrious miners, that it would seem superfluous to recommend it to old Californians. It is the oldest literary journal on the coast. [S. F. Mining and Scientific Press.

THE GOLDEN ERA, which has just entered upon its fourteenth volume, is fully entitled to be considered as THE literary paper of the Pacific coast. Its proprietors understand the wants of the community, and furnish their readers with all the popular works of fiction as fast as the proof sheets are received from the Eastern States and Europe, and with a greater variety of original matter in the line of light literature, than can be found in any similar paper on the continent.—[S. F. Alta California.

THE GOLDEN ERA has entered upon its fourteenth year of publication. How many competitors for public favor have been started during this time, and not possessing the freshness and originality of the GOLDEN ERA, have struggled through a short, sickly existence—at last to "flicker out"—almost unnoticed. No single paper in the State is more read and admired, and friends in the States appreciate it fully as highly as the thousands here who weekly scan its columns. It is no copyist, being in all its main features Californian, and unlike the "story papers" in general, its contents are interesting to all who take an interest in the literature of this coast.—[Napa Reporter.

THE GOLDEN ERA, as a good family paper, as a literary production, cannot be surpassed within the limits of America, and America beats the world in publication of first-rate literary papers. It is filled to overflowing with excellent reading matter, original and selected prose and poetry. It is now publishing, from advance sheets furnished from New York, two very interesting stories, each chapter of which is alone worth the subscription price of the GOLDEN ERA.—[Folsom Telegraph.

THE GOLDEN ERA is decidedly the best journal of the kind on this coast, and, we had almost said, in the United States. It is prepared with great care and labor, and publishes an immense amount of reading matter. The serial stories of the best authors are printed in its columns, and its local gossip is always pungent, racy and instructive.—[S. F. Examiner.

THE GOLDEN ERA is one of the best journals of its class in the whole country, and is carefully and intelligently conducted.—[S. F. American Flag.

THE GOLDEN ERA is enlarged by the addition of eight columns of reading matter. It was never more worthy the support of the reading public than at present.—[S. F. Morning Call.

THE GOLDEN ERA is decidedly the best family paper published in the State and we are pleased to learn that it is in a flourishing condition.—[Sacramento Bee.

THE GOLDEN ERA, as a strictly literary and news paper, is chief among the best. Its correspondence and editorials are of that originality of style so peculiar to this coast.—[Oregon Sentinel.

THE GOLDEN ERA is the best literary paper published on this coast. It abounds in stories both real and fictitious, which are worth a careful perusal by every one.—[Santa Cruz Sentinel.

THE GOLDEN ERA is as good a literary paper as can be procured on the continent.—[Red Bluff Independent.

THE GOLDEN ERA has entered upon its fourteenth volume. It is by far the best literary and family paper ever published on this coast.—[Sonoma Democrat.

THE GOLDEN ERA is a most ably conducted literary journal, in every way worthy of its large circulation, and characterized by a flow of wit and freshness of satire in dealing with the prominent follies of the age that is truly refreshing.—[Deseret News, Salt Lake City.

THE GOLDEN ERA is a fine family and literary paper, as the broad Union anywhere can boast of.—[Denver Rocky Mountain News.

THE GOLDEN ERA is the best family journal in the United States.—[Salt Lake City Telegraph.

THE GOLDEN ERA is a highly handsome quarto of fifty-six columns, comprising the freshest and the richest cream of American belles lettres. Nothing north or south, or east or west, can be compared to it as an elegant family and literary newspaper.—[Union Vedette, Salt Lake City.

THE GOLDEN ERA, instead of economizing during these dull times and presenting a paper to match the times, is as brilliant as ever. It has a talented corps of literateurs, and keeps fully up to the mark.—[S. F. Dramatic Chron.

THE GOLDEN ERA is now in its fourteenth year of publication, and is established on a firm basis. It has a larger number of regular contributors, and gives a greater variety of reading matter than any other paper of the kind published in San Francisco.—[Quincy Union.

THE GOLDEN ERA has commenced its fourteenth year with a steady improvement in literary and typographical appearance.—[Yreka Journal.

THE GOLDEN ERA began in the infancy of the State, and has grown with it, until there is now hardly a post office in the State, or on this coast, where it is not taken. It employs the best writers in the Atlantic States, in Europe, and in California.—[Colusa Sun.

ANNUAL REPORT

—OF THE—

Pacific Insurance Company.

IN COMPLIANCE WITH THE ACT OF THE LEGISLature of the State of California, entitled "An Act concerning Corporations," passed April 22, 1850, the Pacific Insurance Company of San Francisco makes the following Annual Report:

I.—The amount of the Capital Stock of this Company is SEVEN HUNDRED AND FIFTY THOUSAND DOLLARS, and paid in GOLD.....$750,000

II.—The amount of the assets is ONE MILLION AND FIFTY-ONE THOUSAND, FOUR HUNDRED AND TWENTY DOLLARS AND THIRTY-SEVEN CENTS..$1,051,420.37

III.—The Company has NO DEBTS.

IV.—The amount of insurance effected during the year, and which remained in force December 31, 1865:

Fire	$12,973,949
Marine	484,408

This Company commenced underwriting Marine Risks, August 1, 1865:

V.—This Company insures against the following risks, viz.: BUILDINGS, HOUSEHOLD FURNITURE, MERCHANDISE, RENTS, LEASEHOLDS, VESSELS IN PORT AND THEIR CARGOES, and other PERSONAL PROPERTY, AGAINST LOSS OR DAMAGE BY FIRE.

Also, on CARGOES, TREASURE, COMMISSIONS, PROFITS, and WAR RISKS, and ON ALL MARINE AND INLAND NAVIGATION RISKS, TO AND FROM ALL PORTS IN THE WORLD.

VI.—This Company will take on any FIRST-CLASS RISK not to exceed $75,000 (the limit fixed by law), and on all large risks will reinsure to an extent consistent with PRUDENCE in other RESPONSIBLE COMPANIES.

Watkins, Geo E	180	20	250 00

And in accordance with law, and an order of the Board of Trustees, made on the 6th day of February, 1866, so many shares of each parcel of said stock as may be necessary, will be sold at the office of the Company, No. 228 Front street, San Francisco, Cal., by Jones & Bendixen, auctioneers, on Monday, the 26th day of March, 1866, at 3 o'clock P. M., to pay the delinquent assessment, together with costs of advertising and expenses of the sale.

E. J. BRINKHOUSE, Secretary.

Office, No. 228 Front street, San Francisco, Cal. ma10

Santa Cruz Petroleum Oil Works Company, Location: Santa Cruz County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 10th day of March, 1866, an assessment (No. 15) of fifty cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, R. Wegener, 415 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 14th day of April, 1866, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 28th day of April, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. WEGENER, Secretary.

Office, 415 Montgomery street, San Francisco, Cal. mar17

Silver Cloud Gold and Silver Mining Company, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 13th day of March, 1866, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately, to the Secretary, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 14th day of April, 1866, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Friday, the 27th day of April, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

N. C. FASSETT, Secretary.

Office, 402 Front street, San Francisco. mar17

United States Mining Company, Virginia District, Storey County, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 7th day of February, 1860, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificates.	No. Shares.	Amount.
Jas L Blaklo	304	50	$25 00
Jeremiah Dwyer	310	20	10 00
M B French	406	50	25 00
Chas Hauson	329	10	5 00

J L Shiman	216	5	2 50
J L Shiman	391	10	5 00
S A Snow	379, 380, 381, 382, 383	10 ea	50 25 00
S W Stoddard	407	35	17 50
Wm Van Housen	390	10	5 00

And in accordance with law, and an order of the Board of Trustees, made on the 7th day of February, 1866, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Olney & Co., at No. 626 Montgomery street, San Francisco, Cal., on Saturday, the 31st day of March, 1866, at the hour of 12 o'clock, M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. M. BUFFINGTON, Secretary.

Office, No. 10 Government House. mr17

Yuba Gold and Silver Mining Company, Brown's Valley, Yuba County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 24th day of February, 1866, an assessment of two dollars ($2) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 210 Pine street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on Saturday, the 31st day of March, 1866, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 14th day of April, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

P. R. RINGSTROM, Secretary.

Office, 210 Pine street, up stairs, San Francisco. mar 3

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alterations which they may desire made in their advertisements at their earliest convenience. New advertisements should be sent in as early as possible.

VOLUME TWELFTH.—The MINING AND SCIENTIFIC PRESS, with its last issue, commenced its twelfth volume. Since Dewey & Co. have "held the ribbons" its gait has been rapid toward a perfect journal. Its appearance evidences its prosperity, but doubtless, like some of the rest of us, it can stand increased encouragement. Let such be given, and, our word for it, volume thirteen will acknowledge receipt.—[Golden Era.

COMPLIMENTARY.—The Stockton *Independent*, in acknowledging the reception of a copy of the biennial school report of our present worthy Superintendent of Public Instruction, suggests that the document should be placed in the hands of each board of school trustees, and every teacher throughout the State. The same paper further takes the opportunity to pay the following well deserved compliment to that officer:

We think Superintendent Swett is proving himself a very diligent, intelligent and earnest friend of popular education—in fact, one of the leading benefactors of this coast—and it is not exactly the thing to hide his light under a bushel by stinting the circulation of his report.

THE STATUE OF LINCOLN.—The artist, Mr. P. Mezzara, is busily engaged in perfecting his statue of Lincoln, which was exhibited at the late Fair of the Mechanics' Institute, in this city. The finishing touches will all be completed by the end of the present month. It is to be placed upon a proper pedestal in front of the Lincoln School House, where the foundation has already been prepared. We understand it will be uncovered to the public on the 15th of April, the anniversary of the assasination of the great and good man, whose memory it is designed to perpetuate. The artist has allowed the statue to be placed there for a mere nominal sum—its cost and the necessary expenses of mounting it. The cost has been defrayed by subscription, and the statue is the first raised in the country to the memory of our martyred President.

Book Printing should be considered and treated as one of the higher branches of the "Art of Arts," and its execution entrusted only to experienced and intelligent workmen. Strict attention will be given to all orders for BOOK AND PAMPHLET PRINTING entrusted to the Mining and Scientific Press Job Office.

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three month's delay requisite in transacting business through Eastern agencies.

J. B. CONE, BUSINESS AGENCY.—Makes private sales of Property and Business Places of every description, in the city and throughout the State; procures partners with large and small amounts of money; negotiates sales o mining property, and does a General Agency Business. Patronage solicited by mail, express, or by personal application at the office, 402 Montgomery Street, San Francisco, Califor ia. 23v11tf

FOR SALE.

Owing to the great distance from our point of manufacture, we offer for sale the State Right of California for our

Patent Bor'ng Tools for Artesian Wells,

Illustrated upon the first page of this paper February 17th. These Tools are now in use in the various Oil Regions of Pennsylvania, Ohio and Virvinia; and although but just introduced, are universally approved and admired, and bid fair to become eventually the most popular tools in use. We shall close without reserve to the party sending us the higbest bid, to whom we will mail a complete set of Drawings, copy of Circulars, etc.

GEORGE E. BROWN,

(Late Assistant Examiner in the U. S. Patent Office,)

HAVING RESIGNED THAT POSITION AFTER A TENure of office of eighteen months, offers his services to

INVENTORS AND THEIR ASSIGNEES,

—AS A—

Patent Solicitor,

He will make Preliminary Examinations in the Patent Office, with a view to ascertain the Patentability of any invention that may be submitted to him for that purpose; will prepare the necessary papers for those who wish to make Applications for

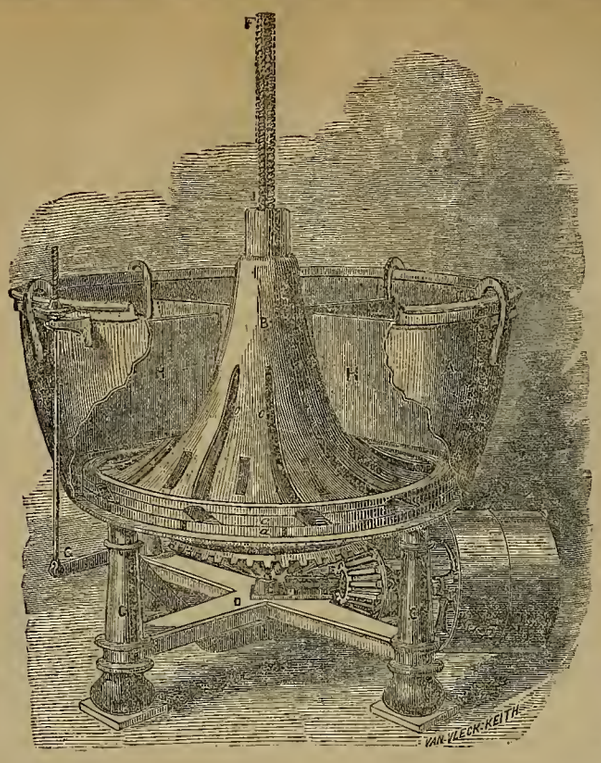
Patents for their Inventions,

—OR FOR—

EXTENSIONS OR REISSUES OF PATENTS

Already granted; will act as an Attorney in presenting Applications at the Patent Office, and in managing them to a final issue; will draw up Assignments; will examine into the condition of Rejected Applications when desired to do so, and undertake the prosecution of such as may be considered patentable, and do whatever else is usually done by Patent Solicitors.

Address, P. O. Box **237**, Washington, D.C. 7v12-3m



THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and *o*, Openings,

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

LICK HOUSE,

Corner of Montgomery and Sutter streets,
SAN FRANCISCO.

S. ALSTROM AND G. S. JOHNSON, Prop'rs.

This elegant and commodious Hotel is situated on the principal promenade street of San Francisco. The Lick House is finished and furnished with a degree of beauty and excellence unsurpassed, combining all the modern applications and arrangements of a FIRST CLASS HOTEL, thus offering superior inducements to the traveling public. The proprietors assure their patrons that the Lick House shall not be excelled in any of its appointments, or in polite attendance or attention to all the comforts of its guests.

THE PRESS is a large, sixteen-page paper, and is truly a valuable assistant to the mining interests of the Pacific Coast.—Inye County News.

FRENCH SCIENTIFIC EXPLORATIONS IN MEXICO. Napoleon III., it appears, seeks to imitate in Mexico the work for science and the arts which Napoleon I. accomplished in connection with the expedition to Egypt. The Minister of Public Instruction, in a report addressed to Emperor, proposed the appointment of a commissioner to prepare instructions for an expedition, and to superintend the publication of the results of observations on that country, made in connection with the army. In regard to the minerals and mines of Mexico, the report says:—

"What has been done by mining associations is worthy of praise, but what is known as yet of the mineralogical wealth of Mexico is undoubtedly the smallest part of that which exists. The sites thus far turned to profit are those, for the most part, which hazard has presented. A truly scientific exploration would disclose to this branch of industry a future of unexpected prosperity."

A SINGULAR RULE.—The Boston School Committee have so amended their school regulations as to forbid any teacher from receiving a present from any scholar or class in the public schools in that city. Not even a graduating class is allowed to make any demonstration of that kind of their appreciation of a teacher under whose direction they received their education. Such a rule appears unnecessarily arbitrary and severe, and would hardly be thought of in any other locality than the "city of notions;" albeit Boston has *some* most excellent notions, and especially about school teaching.

SCHOOLS IN TULARE COUNTY.—A correspondent of the Visalia *Delta* calls particular attention to the pleasing fact, and one which speaks volumes for the people of Tulare, that while in 1860 there were only five schools in the county, in 1865 there were *fifty*, and increasing in numbers. Those schools are well attended, and a general anxiety is manifested in the great cause of education.

Removal.

The Office of the MINING AND SCIENTIFIC PRESS has been removed to the old printing stand known as Waters Bros. & Co., southwest corner of Clay and Sansome streets, opposite the Niantic Hotel (being one block south of our former location), where we may now be found, with more commodious apartments and an extensive JOB PRINTING OFFICE.

San Francisco, April 10th, 1865.

To Printers.

We have for sale, at a bargain, a Second-hand Half-Medium (largest size), Ruggles' Engine Job-Printing Press, of most approved pattern. It is in excellent condition, and warranted to work as good as new. Apply soon, at the office of the MINING AND SCIENTIFIC PRESS. 19v11tf

BACK VOLUMES.

Back files of the MINING AND SCIENTIFIC PRESS, from January 1st, 1864, to the present time, will be furnished at $3 per volume of six months; bound in cloth, $5

A Good Financial Weekly.

The Stockholder:

MONITOR OF FINANCE AND INDUSTRY,

Is published every Tuesday Morning,

At 72 William street, New York,

—GIVING—

Quotations of all important Bonds and Stock Securities in the United States; GOVERNMENT, STATE, CITY, BANK, INSURANCE, PETROLEUM, MINING, and other miscellaneous Joint-Stock Organizations, with the Financial Statements of the same; Notices of Payment of Interest and Dividends—

fact, all matters that can be of interest to Security-holders.

Its columns will be found replete with important and useful financial information.

The Quotations given are correct, and may be relied upon either for the purchase or sale of Bonds or Stocks.

THE STOCKHOLDER is the *only strictly financial paper published in the United States.*

TERMS, FIVE DOLLARS PER YEAR.

All letters should be addressed,

GEO. M. NEWTON, Publisher,

5v12tf 72 William street, New York.

Economy in Advertising.—THE MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. THE PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

Machinery.

HUNTER'S
PREMIUM
CONCENTRATOR, AMALGAMATOR
AND SEPARATOR,

Awarded a Silver Medal at the late Mechanics' Fair.

HUNTER'S CONCENTRATOR CAN BE SEEN IN OPERATION daily at the Novelty Iron Works, Fremont street. Parties wishing to purchase Concentrators will find it to their advantage to examine the above machine before purchasing elsewhere, for the following reasons:

1st. It will work the sands from a 5-stamp battery, and save from 10 to 20 per cent. more sulphurets than any machine built on the Pacific coast.

2d. The Sulphurets are washed clean, containing less than ten per cent. of sand.

3d. The waste free gold and amalgam is amalgamated on the copper plates; not a particle of ground mercury and scarcely a trace of metal passes off with the sand.

4th. Its simplicity is a sufficient recommendation for its general use as a Concentrator. The variation of speed in a Quartz Mill does not effect the working of the Machine. The same was demonstrated at the late Mechanics' Fair, when with the greatest IRREGULARITY OF SPEED the best of results were given.

5th. There is no clogging or stopping to clean out the sulphurets and sand; consequently no waste from any inattention on the part of the attendant

6th. In exhibiting the working of the machine (it is not run empty), all classes of ores and tailings, from 50 pounds and upwards, are concentrated that parties may see fit to test the machine with.

Give it a trial, and satisfaction is guaranteed. All orders and any information required, address,

ANDREW HUNTER,
Novelty Iron Works, Fremont st., San Francisco,
15v12-3m OR to E. T. STEEN, Agent.

BAUX & GUIOD'S
Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crall's Gravel Cement Works, Nevada county; Willman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Heugh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6tf

BLAKE'S
QUARTZ BREAKER

Is now extensively used for breaking hard masses of
Quartz or Ores
To a size suitable for stamps. These machines are patented, and are in practical operation in

CALIFORNIA, AUSTRALIA,
WASHOE,
ENGLAND, FRANCE,
— AND —
THE ATLANTIC STATES.

These Machines, or circulars containing further information regarding them, may be obtained of the undersigned.
Address,

BLAKE & TYLER,
Box 2077 San Francisco Post Office.

CHAS. T. BLAKE, Idaho City. E. TYLER, Michigan Bluff. WM. P. BLAKE, San Francisco.
4v10

Hepburn & Peterson's
AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amidgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ The Amalgamator may be seen in operation at the European Metallurgical Works, Bryant St. bet. 3d and 4th.

{Illustrated in the Mining and Scientific Press, April 9th, 864.}

Portable Steam Engines!

"Hendrie's" and "Hittinger's" Make,

COMBINING THE MAXIMUM OF EFFICIENCY, Durability, and Economy, with the Minimum of weight and Price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes

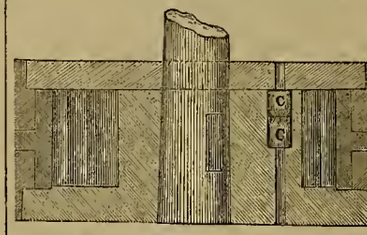
Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of milling enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world

All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Grist Mills.

For sale by **TREADWELL & CO.,**
3v12-3m Corner of Front and Market streets.

Stevens' Pressure Packing.



Patented March 7th, 1865.

Pressure Packing is now conceded, by the best engineers, to be the most effectual method of making and keeping the metallic ring of pistons steam-tight.

STEVENS' PACKING has the advantage of being cheaper in first cost than the ordinary packing, and can be applied to old style pistons with very little alteration or detention. In place of testimonials, the Patentee requests of those who are using the old spring packing to inquire of the owners of the various engines which now have this packing in use—some of which have been running from three to twelve months without being opened, or showing any descriptive leak—and act upon their recommendation.

Further particulars can be had by applying to the Patentee, ANDREW STEVENS, Master Mechanic, Alameda Railroad, or at the VULCAN IRON WORKS, where they can be seen, at any time, in course of construction.

10df **ANDREW STEVENS.**

QUARTZ OPERATOR'S
HAND BOOK

A Book for Every Intelligent Prospector, Shareholder, Miner and Machinist.

ZENAS WHEELER AND P. M. RANDALL,
Authors and Publishers.

BOUND IN CLOTH—144 PAGES, DUODECIMO.

THE QUARTZ OPERATOR'S HAND BOOK is presented to the public as a carefully prepared epitome of all that is valuable for the practical operator in the mine and mill. We have here all the most necessary hints and directions for testing and assaying the ores of the various minerals; an explanation of chemical terms; a brief and intelligible description of the numerous processes for roasting ores, and the extraction of metals from their ores by amalgamation and otherwise.

The work also contains an original and highly interesting discussion of the tractory and differently formed grinding plates, as applied to the reduction of ores—a subject not only of special interest to the scientific reader, but also practically of the highest importance to every quartz miner

Professor Silliman, of Yale, and Hodgson, of the College of California, having examined this discussion, as submitted to them by its author, Mr. Randall, previous to the compilation of this work, speak of the same as not only mathematically correct, but also as of great practical value. Messrs W. R. Eckart, Jr., Engineer, (late of U. S. N.,) and W. M. Belshaw, assayer and superintendent of the S. T. M. Co., to whom the entire work was submitted while passing through the press, speak of the same as one of high practical importance to quartz miners and millmen generally.

No work has been offered to the mining public of California which contains so much valuable information, condensed into so convenient a space as is here presented. In its preparation, much care has been taken to secure brevity, conciseness, and simplicity—in fact to make it a complete and reliable QUARTZ MINER'S HAND BOOK.

☞ The Table of Contents of this book will be found on page 415 of the MINING AND SCIENTIFIC PRESS of July 1st, 1865.

Sold by booksellers generally. Price by mail, postage paid, $1.25. Address "Wheeler & Randall, at the Mining and Scientific Press Office, San Francisco." 2v11

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, but one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the **PACIFIC FOUNDRY,**
1v1 San Francisco.

Prater's Patent Concentrator

(Known as HUNGERFORD & PRATER'S Concentrator,)
MANUFACTURED AT THE
San Francisco Foundry and Steam Engine Works.

Corner Fremont and Mission Streets.

All orders promptly attended to.

2v12 **DEVOE, DINSMORE & CO.**

Important to Miners.

NEW PATENT ROASTING PROCESS.

I AM NOW PREPARED TO OFFER TO THE MINING community a New Roasting Process, which has been approved as novel and beneficial by the best authorities in Europe. A Furnace can be erected in a few days at a trifling expense, and one man is able to Roast ten tons of Ore or Concentrated Sulphurets per day,

MORE COMPLETELY AND CHEAPER

Than any other Process. All the Sulphur is saved, by being converted into Bisulphide of Carbon, which is a valuable product, and will pay nearly all expenses.

For particulars, apply to

J. MOSHEIMER,
26v11-3m 423 Washington street.

FOR SALE!
A STEAM ENGINE!

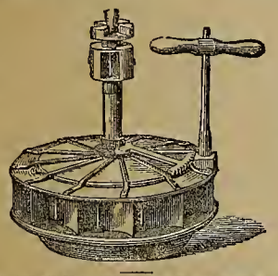
LEFFEL'S
American Double Turbine



THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given unusual satisfaction wherever used, is now for sale by KNAPP & GRANT, 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These Wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 500 feet fall. Let us know how much water you have either in miner's inches or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to

KNAPP & GRANT,
San Francisco.

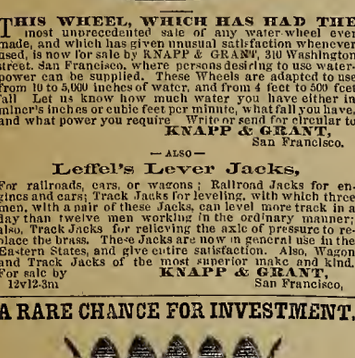
—ALSO—

Leffel's Lever Jacks,

For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make and kind. For sale by

KNAPP & GRANT,
12v12-3m San Francisco,

A RARE CHANCE FOR INVESTMENT.



FOR SALE—THE PATENT RIGHT, FOR STATES, towns and counties, for the best

CHIMNEY TOP

Ever Invented. Numerous testimonials from Proprietors of Factories, Foundries, Steamers, Hotels, etc., can be shown, attesting to its usefulness in creating draft, saving the expense of high chimneys, and a great saving of fuel. Pamphlets containing descriptive drawings and testimonials will be sent free, upon application by letter or otherwise to the patentee,

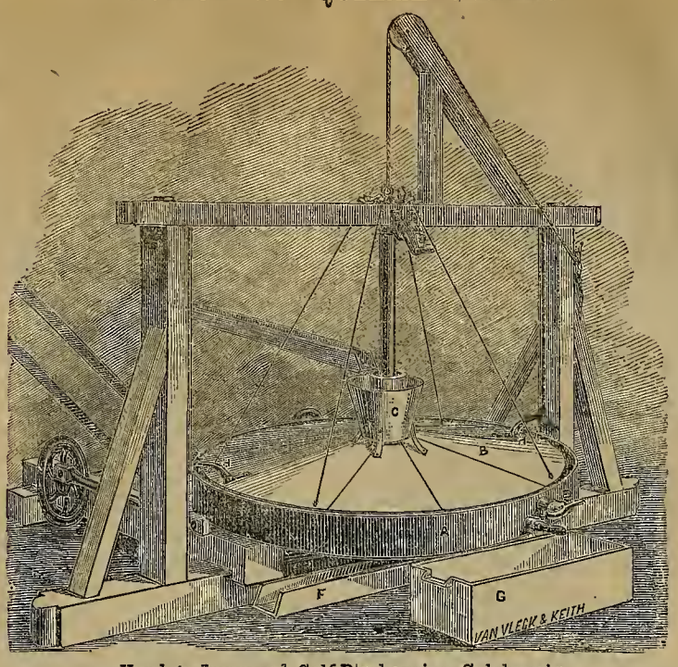
NOTICE TO QUARTZ MINERS.



Hendy's Improved Self-Discharging Sulphurets

PRATER CONCENTRATOR

Is Receiving Universal Favor.

Reference is made to the following Mills which are using the Prater Concentrator, with some of the improvements attached. The Self-Discharging Sulphurets has been more recently adapted, and the public attention is called to examine its workings:

STEPHENS' MILL, Humboldt County, Nevada.
CHRYSOPOLIS MILL, " "
U. S. REESE RIVER MILL, Austin, "
CARROL & ASPINWALL MILL, Reese River, Nevada.
UNION MILL, El Dorado County, near Mud Springs.
NEW YORK AND EL DORADO CO., "
BLUE LEDGE MILL, near Spanish Flat, El Dorado Co.
CONEY MILL, Jackson, Amador County.
Messrs. TUBBS & CO'S MILL, San Andreas, Amador Co.
WINTER'S MILL, Angels Camp, Calaveras County.
CLIO MILL, Jacksonville, Tuolumne County.

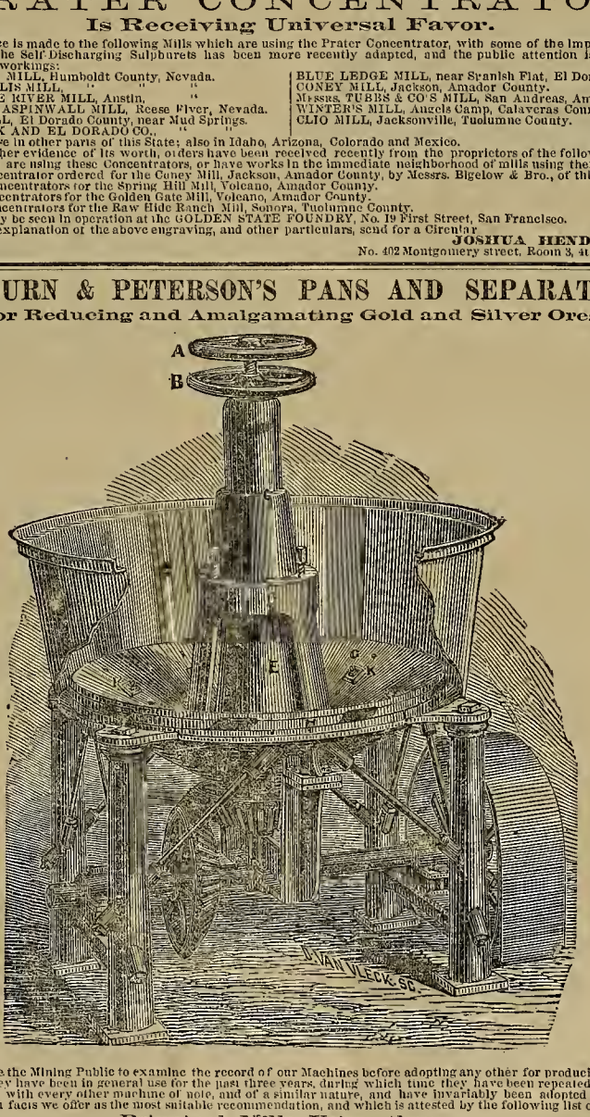
And in use in other parts of this State; also in Idaho, Arizona, Colorado and Mexico.

As a further evidence of its worth, orders have been received recently from the proprietors of the following mills, all of whom are using these Concentrators, or have works in the immediate neighborhood of mills using them, viz.:
One Concentrator ordered for the Coney Mill, Jackson, Amador County, by Messrs. Bigelow & Bro., of this city.
Three Concentrators for the Spring Hill Mill, Volcano, Amador County.
Two Concentrators for the Golden Gate Mill, Volcano, Amador County.
Four Concentrators for the Raw Hide Ranch Mill, Sonora, Tuolumne County.
They may be seen in operation at the GOLDEN STATE FOUNDRY, No. 19 First Street, San Francisco.
☞ For explanation of the above engraving, and other particulars, send for a Circular.

JOSHUA HENDY,
8v12tf No. 402 Montgomery street, Room 3, 4th floor.

HEPBURN & PETERSON'S PANS AND SEPARATORS.

For Reducing and Amalgamating Gold and Silver Ores.



We invite the Mining Public to examine the record of our Machines before adopting any other for producing similar results. They have been in general use for the past three years, during which time they have been repeatedly tried in comparison with every other machine of note, and of a similar nature, and have invariably been adopted in preference; which facts we offer as the most suitable recommendation, and which is attested by the following list of

Principal Mills Using them:

Names of Companies.	Location of Mill.	Names of Companies.	Location of Mill.

Pacific Mail Steamship Co's
THROUGH LINE TO NEW YORK,
Carrying the United States Mail.

LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M., on the **10th, 19th,** and **30th** of every month (except when those dates fall on Sunday, and then on Saturday preceding) for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departure of the 19th connects with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America.

Departure of 10th connects with English steamer for Southampton, and P. R. R. Co.'s steamer for Central America.

Departure of the 30th connects with English steamer for Sumaco, the port of the new mines.

The following Steamships will be dispatched on dates as given below:

STEAMERS FOR MARCH.

30th—CONSTITUTION.....Capt. F. R. Baby,
Connecting with HENRY CHAUNCEY, Capt. Gray.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

For Merchandise and Freight apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

THE CIRCULATION of the PRESS, already extensive, is rapidly increasing, and substantial men who can profit by widely disseminating information of their business amongst the most intelligent, influential and industrial classes of the Pacific States and Territories will find no more effectual or economical medium for advertising.

DEWEY & CO., Proprietors.

Patent Agency and Job Printing Office, 505 Clay street, San Francisco. April 1, 1866.

Look Out for Illegal Advertising!

All assessments of corporations levied on, or subsequent to, March 26th, are governed by the new law approved on that day. We notice some six or eight important mining companies are advertising their assessments illegally in the daily press of this city. As the new law is more liberal in its provisions for advertising than the Act of 1864, these companies have yet time to retrace their steps and begin anew and right. We speak of the matter for the benefit of all concerned. We have prepared a set of correct blank forms for advertising assessments, which we furnish free on application at our office, together with rules for advertising and copies of the new law.

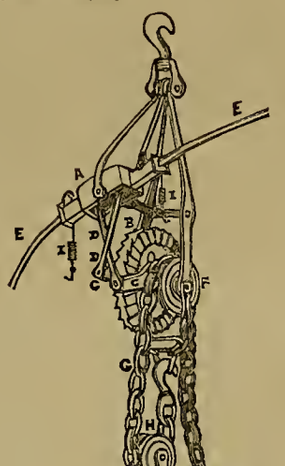
Mining Laws of 1866.

It is our intention to issue, in cheap pamphlet form, previous to May 1st, a full and correct copy of all laws relating to mining adopted by the California and Nevada State Legislatures of 1866. Some of these Acts are of vital importance to every citizen interested in mining.

A COMPANY of French capitalists have bought the lands of the St. Mary's mineral land company, on Lake Superior, for three millions of dollars in gold.

CRAWFORD'S ELEVATOR.

We have recently had the pleasure of witnessing the operation of "Crawford's Stamp and Rock Extractor and Elevator," at the warehouse and workshop of the California Steam Navigation Company.



The above figure represents the machine detached from its bearing, and consisting of a rocking beam, A, connected with a ratchet wheel B, by pawls CC, and cross hangers DD, so that when the beam is rocked by means of the levers EE, the wheel is kept in motion, carrying round with it a sprocket or chain wheel F, to which it is cast solid, and over which a heavy chain G, passes, and is kept from slipping by flanges projecting between the links, so that the more weight there is attached, the more securely it is held to the wheel; while any length of chain may be used, and a body raised to any hight. To double the power and strength of the machine, a heavy iron pulley H, is attached, as seen in the cut.

To reverse the action of the machine, spiral springs II, suspended from the arms of the rocking beam are hooked to the cross hangers, and with the same motion of the levers the wheel turns back, lowering the weight as far as necessary.

By giving proper proportions to the levers, etc., the theoretical power may be rendered very great, while the machine itself is very compact and simple.

The apparatus, as we saw it, appears to be well constructed, and its practical power may be inferred from the following facts. A piece of iron weighing 4,048 pounds is lifted easily by a man using only one hand, with a machine weighing say twenty pounds, and that could be packed in an ordinary carpet sack. A larger machine, weighing less than four hundred pounds, worked by two men, lifted two boilers weighing *fourteen tons*, as readily as the smaller one did the 4,048 pounds, and with four men at the brakes it is calculated to easily raise an engine weighing *forty tons*.

The machine may be suspended from shears for the purpose of pulling stumps, or it may be supported in a similar manner on a strong frame with wheels, thus forming a powerful sling cart for transporting rocks and other heavy bodies.

The uses to which such a machine can be applied are very numerous, and the San Francisco and San Jose R. R. Co. have ordered one of the larger size, for the purpose of lifting their locomotives while repairing them, it being more convenient to lift them thus than by hydraulic pressure. For raising boulders in hydraulic claims, hoisting anchors, and similar purposes, it must prove quite handy.

The invention was patented February 18th, 1862, and was recently brought here by Mr. J. L. Atkinson, who has the patent right west of the Rocky Mountains. He has associated himself with Mr. G. K. Gluyas, of the C. S. N. Co., in the business of manufacturing and selling them in this State. Some half a dozen Lifters have already been ordered, and the manufacture of them will be commenced immediately in San Francisco.

NEW INVENTIONS.

OIL EXTRACTOR.—Squarza, the celebrated punch manufacturer, has just received a patent from the United States, through the MINING AND SCIENTIFIC PRESS Patent Agency, for a new and ingenious machine for extracting essential oils from fruit, (such as oranges, lemons, pineapples, etc., without injury to them,) which consists of a hopper in which the fruit is placed, passing down through a series of compartments in which are placed sharp-pointed pins. The machine being slowly revolved, the fruit is transferred from one compartment to another, until the oil is essentially extracted. The inventor says, "I claim the compartments C D E F, having one or more perforated fixed covers, L, adjustable cover, K, with point, t, t, or their equivalents, arranged as herein described, and for the purpose set forth."

NEW MODE OF SHIP-BUILDING.—Mr. Joseph Halleck, of Grass Valley, has designed the following mode of building war and passenger steamships, which consists essentially of three keels, with three narrow compartments in the hull, giving two longitudinal spaces or tunnels on each side of the middle compartment, or main ship, above the water line. In these spaces the propellers or wheels are placed. They also afford fresh air for ventilation.

For ships of war the middle compartment, it is claimed, may be used as a ram, presenting a beak that would strike terror to the beholder Plates of iron cover the whole ship above the water line, and for a sufficient distance below, forming a rim with almost an acute angle, having port-holes around the whole ship, about on a line with the main deck. The upper surface arching over the whole ram is so arranged that, should the enemy's missiles strike the rim, or any other portion of the ship, they would glance either way over the arched surface above the deck, or down the angular sides of the vessel, and fall harmless into the water.

For affording comfort to officers and men, a cabin is placed above the deck, to be lowered when in action, together with the smoke-stack, and an iron grating placed over the spaces, leaving nothing above the deck but the pilot house.

The inventor is confident that passenger ships, as well as ships of war, can be constructed after his model that would cross the ocean in less time than any other known vessel in modern naval architecture, and with less liability of foundering at sea. A caveat has been ordered filed through this office.

NEW LOCOMOTIVE PICTURE.—Mr. S. P. Sanders, a roving, genuine artist, just now located at San Leandro, has laid upon our table a fine photographic view of the new locomotive, J. G. Kellogg, which has just been completed at the works of the Alameda Railroad Company, on the Encinal. The Kellogg weighs about twenty tons, is a regular built locomotive, of first-class appearance, according to the picture drawn by the truthful rays of the sun. Mr. Sanders also succeeded admirably in obtaining a perfect view of the Alameda workshops and engine-house. In our opinion there are but few photographers on this coast who can equal our friend Sanders in out-door views.

PAPER AND STATIONERY HOUSE.—Messrs. John G. Hodge & Co., at 418 and 420 Clay street, one of our most substantial importing firms, have recently extended their salesrooms by the addition of another story. Their stock of fine paper, blank books, stationery, etc., is choice and complete. Having dealt with these gentlemen ourselves with much satisfaction, we take pleasure in recommending their house to others.

CORRESPONDENCE.—"E. C. W.," Millerton, Fresno county, will receive attention next week; also, another letter from "Prospector," El Dorado county. Editorial items from Nevada county may be expected soon. We give this week some very interesting communications, and would call especial attention to the articls relating to the use of sodium, which emanates from the pen of one of our most experienced and reliable metallurgists.

COMMISSIONER TO THE WORLD'S FAIR. Mr. W. B. Ewer, principal editor of the MINING AND SCIENTIFIC PRESS, has been appointed, by concurrent resolution of the State Senate and Assembly, Commissioner from California to the World's Industrial Exhibition, to be held at Paris, in 1867. Mr. Ewer is now on a visit to his former residence, Grass Valley, and we congratulate him upon the distinguished honor thus voluntarily bestowed upon him. His many years' service in the cause of progressive science in California eminently qualifies and entitles him to the position.

JUST ISSUED.—The Seventh Annual Circular of the Miners' Foundry, printed at the Book and Job Printing Office of the MINING AND SCIENTIFIC PRESS, is now ready for distribution. Copies will be forwarded, free, by addressing "Miners' Foundry, San Francisco." It contains much interesting matter, and is the largest and most complete illustrated pattern list and advertising circular yet issued by any foundry on this coast.

THE deposits of gold and silver in the Philadelphia Mint for the month of February, were $1,408,652.06. The coinage was $960,033.50.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

THE TRACTORY CURVE, AND THE PROPERTIES OF GRINDING PLATES.

BY W. A. GOODYEAR.

[CONTINUED FROM PAGE 178.]

We will next consider hollow, conical plates of uniform hardness.

Referring to the figure on page 109 of the Hand Book, and letting as there, $a =$ the radius of the hase, and h, the altitude of the cone, while y denotes the radius of any point in the surface, and also letting P denote the vertical pressure at the outer circumference when the plates are in motion, the vertical thickness of the upper plate heing uniform, we have the surface of that portion of the cone, the radius of whose hase is y.

(69) $S = \pi y^2 \frac{\sqrt{a^2+h^2}}{a}$. Differentiating (69), we ohtain

(70) $\frac{dS}{dy} = 2\pi y \frac{\sqrt{a^2+h^2}}{a}$. Now, the vertical pressure at the circumference is P. Therefore, its component there in a direction perpendicular to the surface, is

$$P \frac{a}{\sqrt{a^2+h^2}}.$$

Again, in this case, as well as in that of circular plates, and for the same reason, the actual wear of the plates must he uniform. Hence, we must have now the vertical presure at any point whose radius is y, $P' = P\frac{a}{y}$, the component of which, perpendicular to the surface, is

$$P'' = P\frac{a^2}{y\sqrt{a^2+h^2}}.$$

The distance passed over hy the same point in one revolution is $2\pi y$.

The expression for the grinding effect is, therefore,

$$(71) \int 2\pi y \times \frac{P a^2}{y\sqrt{a^2+h^2}} \times 2\pi y \frac{\sqrt{a^2+h^2}}{a}\, dy = \int 4\pi^2 P\, ay\, dy,$$

which, taken hetween the limits 0 and a, gives

$$(72) \int_0^a 4\pi^2 P\, ay\, dy = 2\pi^2 P a^3,$$ for the total effect in one revolution.

Let us now consider tractory conoidal plates. If the plates be of uniform hardness, the *actual* wear in a vertical direction, in this case as well as in the others, *and for the same reason*, must be uniform. It has already been shown that when the plates are at rest, the pressure in a vertical direction is uniform; and if this pressure he represented hy R, then its component in the direction of the normal is $R\frac{y}{a}$.

Now, when the upper plate revolves, the condition that the vertical wear shall he uniform, requires in this case as well as in the others that the product of the pressure in this direction into the distance passed over shall be constant, and hence if P represent the vertical pressure at the circumference, when the plates are in motion, and P′ the vertical pressure at any point whose ordinate is y, we shall have

$P : P' :: y : a$, or

(73) $P' = P\frac{a}{y}$, and the normal component of P′ will be

(74), $P'\frac{y}{a} = P$. The *normal* pressure then in *revolving* tractory conoidal plates of uniform hardness is coustant.

Since, now, from equation (32), $\frac{dS}{dy} = 2\pi a$, we have for the grinding effect, in a single revolution, the expression

(75) $\int 4\pi^2 P\, ay\, dy = 2\pi^2 P\, ay^2$, which, taken hetween the limits 0 and a, gives

(76) $\int_0^a 4\pi^2 P\, ay\, dy = 2\pi^2 P a^3$.

Since the normal pressure is constant and equals P, the product of the pressure into the distance passed over in a single revolution is $2\pi P y$, and it might seem at first, therefore, that the *wear* in the direction of the normal should be proportional to the ordinate. But upon reflection it will he seen that this cannot he the case herc, for the plates could not follow each other and remain in contact under this condition. The reason why they could not do so is, that if the actual normal wear *could* he proportional to the ordinate, the plates would wear into surfaces whose meridian curves would he hranches of the secondary curve I have already discussed, and the branch belonging to the upper (or convex) plate would have a much greater curvature (I call the *curvature* greater when the *radius of curvature* is less) than the one belonging to the lower (or concave) plate, so that the plates would then remain in contact only along the circumference of a circle at their top, while their lower portions would he separated hy a space increasing from the top downwards, and this is an impossible coudition of things to produce hy grinding.

It may at first seem strange that this should be so, while the product of the normal pressure into the distance passed over varies as the ordinate. But the simple fact of its seeming strange does not invalidate the reasoning nor the correctness of the result.

There is nothing about it more strange than there is in the properties of a curve and its asymptote, or in the simple fact that two points which are separated by a finite distance may continually approach each other in a right line, and yet never meet.

[Concluded next week.]

If I were the father of a family, all the members of it should learn music. Almost all children have naturally good ears and can catch tunes easily; and, strange to say, they are able to master the mysteries of time much better at an early age than they do later. Both girls and hoys should be taught to play upon the piano forte, which, altbongh it wants the power of melting one sound into another—that touching human effects which some instruments possess—is invaluahle as bringing almost every variety of music within reach, and permitting one, through arrangements and adaptations, to become acquainted, to a certain degree, with nearly all the thoughts of the greatest composers. At a more advanced age I would have them learn the grammar of music, thorough hass and harmony. The knowledge of the principles upon which the greatest men worked, and the examination of the manner in which they worked, would he a study of great interest, and could hut add to the admiration with which they might happen to he regarded. Those of my children who were great musical geniuses would only build the better for building upon such a foundation; and those who were not. having heen taught by their early studies what real greatness is, and hy the same process to comprehend what real littleness is also, in default of the charm of talent would probahly achieve that of modesty, and instead of becoming indifferent executants, would resign themselves to heing intelligent listeners—a race of which the world stand greatly in need.—*Horace Mann.*

Sodium in Excess on Rich Silver Ores.

BY G. KUSTEL, M. E.

It was stated already hy Mr. Beadwin (North Wales) "that the sodium amalgam will attack also base metals if added in excess, and reduce the hencficial effect of the mercury, which consists chiefly in the reduction of protoxide and sulphuret of mercury, keeping it thus from sickening and flouring. The mercury hecomes loaded with hase metals and its action on silver and gold is greatly reduced."

The attack of sodium on hase metals is a chemical one, arising from the endeavor to unite with the sulphur, oxygen, etc., comhiued with the base metals, whereby the latter are freed and amalgamated. Silver sulphurets are decomposed by the sodium readily; and this process is not disturhed hy the presence of hase metal sulphurets. Independent of all accessory circumstances, one pound of sodium would amalgamate about three and a half pounds of silver out of silver sulphuret. One ton of ore, assaying 200 ounces of silver, would require four pounds of sodium (at the cost of $5, London price,). Four pounds of sodium are equal to 100 pounds of hard sodium amalgam (ahout 77 cents per pound.)

To ascertain what part of the silver would he reduced hy a definite quntity of sodium in presence of water, iron and base metal sulphurets, and in what coudition the quicksilver is kept during the operation as to its collective power, an experiment was made in the Miner's Foundry, San Francisco, in one of Wheeler's small pans, with rich auriferous silver ores, (mostly from Comstock ore,) containing lead, zinc, copper, antimony and arsenic:

1. Six pounds of the ore were introduced into the pan, with so much water as to render tbe pulp thick enough to keep tbe mercury globules suspended. Two pounds of quicksilver were added immediately, and three pounds more coutaining six ounces of four per cent. sodium amalgam—that is, one ounce of sodium amalgam to each pound of ore were introduced in equal portions every fifteen minutes. No heat was applied. The mercury, on examination after each addition of sodium, remained uniformly parted in globules; the condition of the pulp did not permit a union. After a two hours run the ore was diluted, a small quantity of sodium amalgam added for tbe purpose of collecting the floured part of the mercury, and the pulp discharged; the dies were taken out, and the pan cleaned perfectly.

2. Six pounds of the same ore were charged as before, with the addition of five pounds of quicksilver—but all at once. The pulp was made hot by steam, and the amalgamation continued for two hours without any chemicals. After this time the charge was diluted and discharged.

The results of both experiments appeared in the following proportions:

No. 1, with sodium, yielded, per ton, 91.7 ounces of silver and 18.3 ounces of gold; total, 110.0 ounces.

No. 2, without sodium, yielded, per ton, 276.2 ounces of silver and 60.3 ounces of gold; total, 336.5 ounces.

The assay showed 2,030 onnces of silver and 87 ounces of gold.

The silver yielded of No. I is so much helow that of No. 2, that not only no decomposition of silver sulpburets did take place hy aid of the sodium, but the amalgamation seems to have been checked somehow by the influence of the sodium. It might he, however, tbat the silver, at the rate of 91.7 ounces per ton, is the direct result of the decomposition of tough silver sulphurets by the sodium, while the principal constituent of the ore consists of hrittle silver ore—which, although being decomposed by the sodium, yielded no amalgam.* Judging from the appearance of the quicksilver, the reason of its reduced amalgamating ability is more likely found in the instantly coated condition which it assumes in presence of iron from dies and shoes and finely divided sulphurets. This coating adheres like a skin, and prevents the amalgamation. When the action of the sodium is over, the mercury remains in a lethargic condition, showing less affinity for amalgamation than ordinary quicksilver, without heing loaded much with hase metals. The coating of the mercury, produced hy the action of sodium, may be also the reasou of the very low yield of gold; hut it must he remarked, that the free gold of this ore is not hright, like the quartz gold generally, but shows a mean looking, dull, hlackish appearance. It is also to he mentioned that there are twelve dies in the pan, leaving a space hetweeu each two which is filled up with ore. Particles of the coarser gold which slip into these spaces will also escape amalgamation; hut this inconvenience was alike for hoth experiments. The considerable quantity of gold particles extracted from the tailings of experiment No. 1, when tried in a small vessel, refused to yield to the (magnetic?) power of sodium mercury.

Notwithstanding the character of the gold, and the disadvantage of losing a large proportion of it (compared with tbe whole amount contained in the small charge of six pounds,) hetween the dies, the experiment without sodium gave about 70 per cent. of the assay. The reason of the small yield of 13 per cent. of silver in the second experimeut lies partly in the short time of two hours, hut chiefly in the nature of the ore which requires to he roasted.

The loss of quicksilver was so small in both experiments, that it could not he ascertained by means of the scale. This could not be expected otherwise, on account of the facility of collecting almost all the mercury when small quantities of ore are operated on, especially where there are no sulphates and chlorides present. But the appearance of the mercury in the experiment No. 1 was hy no means very flattering; it was difficult to collect the hlack flocks of coated quicksilver, which could he united into one mass hy the addition of sodium mercury, hut not separated from the sulphurets and iron in the pan. The quicksilver leaves the hlack coat like a skin hehind at slight motions. It has to be proven yet that the loss of mercury is not increased by the use of sodium on silver ore in iron pans, or on ores generally, if rich in sulphurets.

The advantage or disadvantage of sodium mercury can he demonstrated only by comparative working. A mere addition of sodium amalgam, and an unfounded helief that it "does well," is self-deceiving, and of no account.

In regard to the amalgamation of gold-hearing rock with sodium amalgam, Prof. Silliman made most important experiments. Five hundred and twenty-five pounds of poor quartz,—$14.89 per ton—were treated in a Freiherg pan (?) for one hour, with twenty pounds of quicksilver. The amalgamating result was $14.73. No ore of the same kind was treated in the above pan without sodium.

The second experiment, showing a comparative result, was made in a rotating cask. The comparison is less interesting than the actual result, using sodium quicksilver. The cask is known to be one of the least suitahle contrivances for gold extraction; but it answers perfectly for treatment of ores with sodium, as there is no friction required.

* See Scientific Press 1865, p. 306.

[Written for the Mining and Scientific Press.]

From El Dorado County.

[By our Traveling Correspondent.]

Messrs. Editors: Since you last heard from me, "notes hy the wayside" have accumulated to so great an extent that much must necessarily he omitted, which might otherwise have heen interesting to those unacquainted with this region, or to the miner who once gathered in one short season a golden harvest here, hut who now wanders in distant lands, lured onward hy the same bright hope, or excited by the same wild dream that animated him then.

But let none come hastily to the conclusion hecause fortunes are not made here in a day as formerly, to he squandered as soon, that the mines are exhausted. The more I see, and the further I travel, the deeper grows the conviction that we have scarcely yet reached the portals of Nature's storehouse. She has kindly strewn a few rare specimens upon the earth's surface—glittering in the sunlight—to remind us of immense treasures witbin, only to he hronght out hy patient, earnest toil, and judicious investment of capital, and hut for the wild and reckless speculation of the past, resulting so disastrously to all classes, still pressing with nightmare horrors on nearly all, and freezing up the channels in which capital ought to flow, we should now see these vast gold fields cultivated, these rich quartz lodes opened, traces and croppings of which, many of them giving every indication of heing highly metalliferous, and found belting this county from north to sonth for many miles hoth east and west of this place—and we should witness mil-

ons added to the wealth of the country, where ow is eked out a bare substance. A healthy eaction is needed. the first faint tints of its lawn begin to appear.

But now let as came down to some of the acts, which, though dry to many in detail, are one the less important. After passing through 'dot Hill, fifteen miles west of this, where here are some very good placer and hydraulic mines, simil r to those described in former letters, to say nothing of the quartz leads of that neighborhood, one of which at least has paid as high as $60 to the ton. Your "Prospector" was tempted to spend u day, some two miles west of Greenwood, partaking ol the hospitalities of the Penobscot House, breathing the pure mountain air, enjoying the delightful scenery, and rambling among the quartz ledges of the vicinity, of which there appear to be at least three. some 400 feet apart, running parallel from north to south, and passessing, unquestionably, u mineral character to u greater or less extent.

On these, several companies have made locations, and done some work, among which we may briefly notice

THE SHERIDAN,

situated on the middle lode. sufficient developments being made to lay bare a well-defined east and west wall, and prospecting well in gold, which is found in a species of decomposed quartz, not heretofore seen in my route, but afterwards in abundance in other places, of which I shall give some accouat if time and space permit.

THE FREEMAN,

Some distance further south, although not sufficiently opened to show the direction of the lode, exhibits the liveliest looking quartz in this neighborhood, so far as personal inspection went, and contains copper, native, and in form of sulphurets; sulphurets of iron and a little galena, fine-grained—considered a good indication of silver when found in rock known to be argentiferous, hut as no assay of the ore had been made so fur as learned, I cua say nothing definite as to its real value. It certuinly is worthy of a test, and will bo worked tbe enauing season.

THE AUNKER HILL,

Located on the western lode, a short distance south of the stage road, deserves a more extended notiec on aecount of the amoun' of labor performed on it, and the results tberefrom, some $35,000, having been expeaded in the erection of buildings and hoisting apparatus, and in sinking shalts and running drifts, oaly such portions needing description as tend to the elucidation of the subject, the facts given being in part taken from observation above ground, and gleaned as to the interior from statements of the former superintendent aad other gentlemea of integrity well acquaiated with its works.

One of the three shafts of this company was sunk fifty feet—following the lode—variously represented from six to fifteen feet in width, out of which shaft fifteen tons of 18 per cent. copper ore was taken and shipped. This shaft was then lowered fifty-five feet deeper, making a total depth of 105 feet, and judging from the pitch thut the ledge lay east, a cross-cut was made at the 75-foot level or thirty feet from the bottom of the shaft, in that direction fifteea feet, striking the lode, which at tbat point is said to be from ten to twelve feet wide, with eighteen inches of fine pay ore, and sulphurets throughout the ledge. A drift was extended north sixty-five fect along the vein oa 50-foot level, the ore found being represented as of poor quality. Another was rua south seventy-five fcet, the ore in the judgment of at least two of the parties above alluded to, being similar in character und value to that taken from the shaft, and appearing to improve as the drift was extended south, the pay vein beiug near four feet wide. This company are not now at work; their whim, large and substantial as it seems to be, aot being equal to the emergency, tbey iatead securing an engine in a short time, and will resume operatioas, hoping soon to place it among the dividend-payiag claims of tbe country. There is reason to helieve that they will not he disappointed in their expectatioas, in view of the richness of the ore to be seea at the mine, and of the fact that they have already shipped some twenty-fivo tons, averaging about $65 per ton, even at the low rates then ruling, and bave wood and water in abundance at hand.

THE GREENWOOD AND ITS LEDGES.

A large quartz ledge may be distinctly seen croppiag out in various places oa tbe hill immediately west of this well-preserved mining village, lying hid in a deep mountain pass, through which flows a beautiful little stream with sufficient water for mill nnd mining purposes. Two or three companies arc at work ou this lode.

THE EUREKA GOLO AND SILVER MINING COMPANY.

This claim, as I learned from Mr. R. Powning the Superintendent, from whom, also, other facts relating to it, were received, is now owned by so.ne San Francisco capitalists, who intend forthwith to erect a 20-stamp mill. The company first sunk a shaft on the lode to the depth of forty-five feet, finding it six feet in width, and taking ore therefrom which yielded $10 per ton in gold, and $9.50 in silver. Being compelled to abandon this point, in consequence af encountering too much water, they commenced u tunnel at the foot of the hill, and drove it west from the village 160 feet, and struck the lode, proving it here of the same width as above. No rock has been worked from this portion, but it assays $17.50 in gold and $7.50 silver. They extended the tunnel from this point eighty feet in the same direction, and ran through the lode eight feet wide. One ton of the rock from the vein in this place, worked in San Francisco $14 gold. $12 silver. They are now drifting north and south on the vein from the point last mentioned, with four men oa each shift, one carmnn and one assorting the ore, and taking out from fifteen to twenty tons every twenty-four hours.

Adjoining this claim on the north, a company with six men employed, known here as the French company, are doing well, and have laid bare tbe same lode, which showed rock of a blnish gray cast, aixed largely with sulphurets of iron, if my memory can be trusted. They have frequently taken out from $4,000 to $5,000 per week, not from this lode, but from the hill-side above aad from some little quartz veias, varying from half an inch to three inches, aad ia places somewhat decomposed, some of them being clearly traceable as feeders or spare to the large lode, where they seem to be cut off, the quartz in the two having no resemblance whatever, so far as I could discover from a cursory examination. Large as the above fi.ures are, owing to the expense attendant in working the mine, and their "modus operandi," they are aot getting rock as fast as they might. More gold is lost than saved in many portions of this couaty, for waat of proper appliances, whicb nothiag but skill aad capital can procure.

As I have as yet said aothing in regard to Spanish dry diggings, nnd have notes enough witb reference to the minee about Georgetown for another letter, you will soon bear from me agaia. Yours faithfully,

PROSPECTOR.

Georgetown, El Dorado co., March 19, 1866.

[Written for the Mining and Scientific Press.]

Ths Cause of Failure in Mining Enterprises.

MESSRS. EDITORS:—After acarly three years residence ia this portioa of the land of sage brush and silver, and much close observation as to the causes of the apparent failure of miaing eaterprises, it is highly gratifying to observe that at last parties interested in the the varicus leads, with which our sectioa abounds, are commencing "right foot foremost." Hitherto, the process has generally beea in this wise: Parties discover a lead, or rather what has the appearaace of a lead of mineral-bearing quartz. A few assays are made, of course from tbc choicest selection of rock. Aa agent is dispatched to Saa Fraacisco to iaduce moaeyed men to become interested, and to raise a sufficient amount of funds to develop tbe mine. A so-called superiatendent is sent up, probably a good honest maa, and may be "tbe rigbt man in the right place;" hut as nine-tenths of these are totally ignorant of the first principles of either geology, miaeralogy, or metallurgy, it is very evideat that this time the "right place" is seldom fouad. Without evea a prelimiaary survey being made, or any attempt to ascertain the dip of tbe lead, whetber it is a true vein, or simply n displacemeat, the work of "developing" goes on. Perhaps a "boaanza" is struck, and then the next thiag iu order is a mill. A mill must be had—it is absolutely necessary—and without waiting to further investigate or eveu to fiad out the character of tbe lead as to permaneney, etc., estimates are forthwith made for its erectiea. The writer of this bas known iastauces, oa Owens River, and throughout that section of country, of heavy and expensive machinery beiag purchased, shipped aod erected at eaormous expense, before the company had ten tons of mineral-bearing rock ia sight. The estimates nre always too small; assessment after assessment is levied before the mill is finished; the money has given out; the few tons of rock found have been crushed, and, if in great good luck, the company declares a small dividend, to be followed almost immediately afterwards by another assessmeat. Superintendent becomes anxious; he has by this time picked np a few scientific phrases, and has actually made himself believe that he is a practical miner. It is of course neeessury for him to sustain that reputation. He "gouges" round in bis mine, finds a few tons of fair ore, works it, and perhaps pays the expenses of getting it out. And so the work goes on. Not a dollar is spent in real development. Tbe money which should be expended in tunneling, driftiag, and in a thorough prospecting of the vein, goes for stopeing, nnd ruuning the mill. This lasts hut a ehort time, and is aaturally followed by the stopping of the entire work, the disappointment of the stockholders, and the so oftea repeated expression thut "eilver miaing is all humbug."

How often has the writer, ia answer to his questioa, as to the cause of such a mill ceasing operatioas, been answered, "The money is all spent; but (that invariable 'but') it the company oaly had a few thousand dollars more to thoroughly open such or such a vein, dividends would soon follow." This, ia nine cases out of tea, is the fault of the stockholders. Wbea they incorporate or invest in a miae, they do eo expecting that it will almost immediately become a dividend-payiag concern, and ualess the superintendeat orders a mill within three months after commeacing operations, they are anxious to sell out. The experience of those interested ia Recse River, will fully sustain the writer ia these statements.

Of tbe mineral wealth of that section there caaaot be the sbadow of a doubt; but when its rich veins were only partially prospected, came the usual demaand for mills. These were erected at an eaormous expense, and then the discovery was made tbat there was aot one toa of mineral, eitber out or ia sight, where a hundred were aecessary for paying operations. "Montgomery District" is another example. Tbere three mills and an arastra were erected, aad whea completed, in the wbole district tbere had not been fifty tons of ore taken from tbe miaes. Yet the district ie undoubtedly rich, containiag, as it does, such lodes as tbe Osceola, Mountain Queea, Bowmaa aad Mitchell, aad others equully as good. Ia aaother year, when men or companies pursue miaing as a business, regular and legitimate, and aot as a speculation. it will rank amongst tbe foremost on the Pacific slope. The same can be said of Lone Pine and Keys district. Though many of the leads of both are witbout doubt very rich, and have beca discovered aad prospected for the past three years; yet, in neither have there been twenty tons of ore taken from the vein or ia sight.

Ia tbe latter district the Consort compaay purcbased a 10-stamp mill, pans, amalgamators, and all the necessary machinery; or rather, it was purchased for the company by some parties in New York, oa the representations that an immease amount of ore had beea taken out, or could be immediately procured for crushing. On the New York ageat visiting the district for the purpose of examiniug into matters, what was the coasequence? There were aot twenty tons of rock out—not a sufficiency in sigbt to warraat the erection of the mill, and they permitted the machiaery to he sold a few weeks since for freight. It is these misrepreseatations (to use a mild expression) which injure tbe miaes, and in many cases preveat the iavestmeat of the capital necessary for the workiag of the eame.

Is it not then far better to first thoroughly develop a lead before talking about working tbe rock from the firet bonanza struck? *The safest place for the pay ore to be is in the mine, until a sufficiency is in sight to run a mill for at least one year;* let thie course always be adopted, aad together with the advice of Gen. Rosecrans, "that no reduction works should he erected oa a single lode however promising," aad mining will become a legitimate busiuess, and not a mere speculation.

Many may refer to the Comstock lode ne an answer to tbese suggestions. Is there any one at all acquainted with mining who for a moment doubts that the Comstock veia has been most materially injured by the system of gouging carried on for the purpose of declaring most unaatural divideads? It will take years and an immense amount of money to place these mines in a proper working conditiau. From these remarks the writer excludes the Gould & Curry, which, under the supervision of its present superintendent, Mr. Lauis Jauin, (a gentleman who understands the "working," not the "speculative" branch of miniag,) will, be ventures to predict, become in two years time or even less, one af tbe most vnluable aines ia tbe world.

The writer can in no way give a better illustration of his idea of mining thaa the following very homely one: Suppose a company having half a dozen so-called lenils, with a cash capital of $100,000 paid in—they expend this money carefully and judiciously under the management of a MINER (not a lawyer, physician, blacksmith, or carpenter), in the thorough opening, prospecting, and developing their claims—when the veins are struck, when it ie fully ascertained and shown that the mines are good, and there is no louger a doubt as to their wealth, *that* company can procure all the machinery aud mills it requires. Let another, with the same amount of funds, only partially prospect a single lead, and then consume the balance of their money ia erecting a mill, where will *they* find means to go on developing and prospecting their single claim? In other words, and in common parlance, have they aot commenced "wrong end foremost?"

Mining here (in the Blind Spring district) is now being carried on ia the right, and eystematic manner, particularly by the Sierra Blanea and Cornucopia compaoies. Under tbe management of the superiateadent of tbese companies, Dr. Partz, the leads are being thoroughly developed. In both of tbe tunnele and drift of the Elmira rich bonanzas have been struck, and the character of this claim fully nscertained. In the Crocker enough hae been done to guarantee the permanency of the lead, and the work is still going on. The Jupiter, Vulcan, and other leads of the company are being constantly worked, and the indications show every prospect of their equaliag either of the above. In the Cornucopia, after going through the iron, a remarkably rich vein was struck; the orc it is estimated will yield at lenst $1,000 per ton, and several evea richer deposits have been found. But pursuing tbe proper policy ia mining, the superinteadent only takes out such rock ae is aaturally necessary to carry on the developmeat. Every lead must be thoroughly prospected, and a sufficiency of ore must be in sight, before putting up expensive reducing works, to staad idle half the year; no gouging the miaes out, but let the veins be properly opened.

If all the superiatendents would adopt this course, then mining would occupy its proper position, become a business with large, regular, and aever-failing profits, instead of ae now, a mere speculation—this moath a dividead of $50, and the next an aesessment of $100.

Several other parties are aow adopting the same system, and the Humming Bird company (Messrs. Hightoner & Co.) are thoroughly developiag their lead. This is undoubtedly very rich, hut, with a proper feeling of cautiou, they want to see it "sure" before erecting machinery. The Diana is still taking out immensely rich rock, and with their little 4-stamp mill turn out their usual yield of about sixteen pounds of bullion per day.

Tbe owners of this mill dcserve success—both practical, hard-working mechaaics. Like the rest of tbe resideats of this side of the slope, they have experienced all the ups and downs (particularly the "downs") of the past three years, but never losing faitb, they still persevered. Their little mill is (with the exception of the castings) eatirely of their own handiwork, and they are now reaping a rich reward for their untiring energy. The writer only echoes the wish of the entire community when he repeats, "success to Williams & Wicklaad." It is a pity we had not more men of tbeir stamp.

Every thing looks prosperous here, and there is not a man ia this section of the country out of employment who desires work.

Partzwick, Mono county, Jaa. 21, 1866.

SLUICE FOR QUARTZ MILLS.—A patent has been issued to Hugh Logan, of Washoe City, Nevada, for a new sluice for quartz mills. The iaveator says:

I claim the grooved false bottoms, m, in the compartments, c, of the sections of the sluice, in combination with the longitudinal partitions, b, aad pockets, d, constructed and operating substaatially as and for the purpose set forth.

2d. The triangular abutments, e f, in combination with the compartments, c d, of the sluice, substaatially as and for the purpose described.

3d. The yokes, g, with suitable wedges or keys, in combination with the loagitndinal partitions, b, of the sluice, constructed and operating substaatially as aad for the purpose specified.

HOWEVER active a goose's wiags may be in life, tbey become stationary afterward.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, March 31, 1866.

The money market is very easy, and discounts are readily obtained in bank at 1@1¼ ₱ cent. per month. Stock collateral loans have been negotiated this week upon rather more favorable terms to the borrower, and considerable available capital is likely to seek these channels as soon as the market assumes a little more steadiness, and confidence is measurably re-established. It is confidently expected in financial circles that interest on money will rule at low figures the present year, and that many important enterprises will be provided with ample means, and pushed with vigor. A year of active development on this coast is very generally anticipated, and a largely-increased production of the precious metals is also looked for.

The receipts of treasure from the mining districts during the week were $800,000, and the aggregate for the month of March, about $3,800,000.

Bullion has met with no special inquiry of late, owing in part to the low rates prevailing in the East. For the steamer of yesterday Gold Bars were sold at about 840, and Silver ruled at 1@1½ ₱ cent. premium.

Currency Bills on the Atlantic were offered at 23 ₱ cent. premium on Gold. Telegraphic transfers were made at 2¾ ₱ cent. premium, and Sight Drafts, payable in coin, sold at 1¾ ₱ cent. premium. Sterling is quotable at 48½@48¾d for best Bankers' Bills; Commercial do at 49½d.

Legal Tender Notes were in active request early in the week, and considerable sales were made at 77½@80¼; closing at about 77½ bid. Our latest telegraphic advices from the East quote Gold at 131½ on the 29th.

The Share market exhibited a fair degree of activity this week, and nearly every stock on the list has been well maintained. Receipts of Bullion from prominent claims continue unabated, and the average yield for the current month will exceed that of any like period since October last. A restoration of something like former confidence must and will ensue at no distant period, if the better class of mines are enabled to pay regular dividends to stockholders (which now seems probable), and an honest and economical administration of their affairs is adhered to.

Crown Point rose from $1,420 to 1,450, receded to $1,375, rallied to $1,400. and sold yesterday at $1,410@1,400. During the week ending March 24th, 542 tons of ore were extracted from the mine. Considerable ore is now being taken from the extreme west stratum, and the appearance of the incline now down 16 feet from the 300-feet level, is said to be very favorable for a large body of ore at that point. In running south on the 3d level, 220 feet south of the north line, the character and quantity of ore met with has materially improved. Receipts of Bullion from the 1st to 24th instant, amounted to $105,000, and 21½ tons of first-class ore have been reduced this month, yielding $648.46 per ton. The company's next dividend will probably be increased to $75 per foot.

Savage is in rather better favor, and some 50 feet were sold, advancing from $1,025 to $1,100, receding to $1,050, rallying to $1,080, and then dealt in at $1,075@1,060.

The product of the mine recently has been about 50 tons of ore per day. The new or 6th level will be opened next week. The entire indebtedness of the company at the close of this month will probably amount to $25,000, including the installments due upon the Minnesota mill.

Gould & Curry has been inactive and dull, with small sales at $1,020@1,050. The yield of the mine for the month of March, will exceed $160,000, and a dividend of $75 per foot is talked of on the 5th proximo. There is nothing especially new to report save that the ores reduced lately show some improvement.

Yellow Jacket has continued to be well maintained, and considerable sales were made, receding from $800 to $775, rallying to $875, dropping to $860, and changing hands yesterday at $850@$800. The newly-discovered deposit met with in the west drift from the south shaft, lower level, is regarded with decided favor, and is likely to prove a valuable addition to the resources of the mine. The prospect is fair, it is said, for a large body of ore, of better quality than hitherto found in other portions of the claim.

Ophir has been actively dealt in, and some 350 feet were sold, declining from $785 to $725, advancing to $750, and then selling at $695@$735. Latest advices are flattering as to the present appearance of the vein of ore recently met with in the ninth gallery, especially so in breasting out to the north and on the fourth floor. The south drift is now within some fifteen feet of the Central line, but the indications thus far are not so promising in that direction. In addition to the Company's Reduction Works, and the River Mill, the Pioneer, Merrimac, Central, and Lands Mills, are now at work reducing ores, mainly from the lower level. A shipment of $20,000 was made this week.

Chollar-Potosi was less active, and small sales were made, advancing from $400 to $425, receding to $417½, and selling yesterday at $410@$390 The Piute station presents about the same appearance, and is turning out some good ore. The upper stope in the Bajazette Ground continues to look well, and to produce good ore. In the stope near head of incline, the body of ore does not look as well, it is said, as formerly. Station sixty feet below Potosi tunnel still looks promising, and in other portions of the mine there is no material change to report. Drift to the ledge from the new shaft is now in some two hundred and fifteen feet, and progressing at the rate of about two feet per day. During the week ending March 24th, 1,251¼ tons of ore were delivered to custom mills.

Belcher has attracted much more attention, and nearly 300 feet were dealt in, advancing from $305 to $382½, receding to $340, and then selling at $330@345. Favorable indications have been met with recently, but so far as we can learn, nothing very tangible is to be seen as yet.

Alpha has been inactive and dull, with a range of $435@400, closing at $410.

Empire Mill and Mining rose from $215 to $220, receded to $210, and closed at about $220. The new shaft is in working order again, the damage done by the late fire having been fully repaired during the past three weeks. Since the 10th inst., the Company's Mill has been employed in working surface ores and tailings, the receipts from which have been about sufficient to meet current and extraordinary expenses.

Imperial declined from $137 to $125—seller 30, rallied to $143, and sold yesterday at $141@$140. Drifting is vigorously under way from the old shaft, at a depth of 700 feet, and a new level will probably be opened in thirty days hence. The Imperial-Empire shaft has attained a depth of 220 feet.

Bullion rose from $115 to $140—buyer 30, declined to $112½, and closed at $112½@$113.

Overman fell from $69 to $52, rose to 60, and then sold at $52@$53.

Confidence dropped from $50 to $40, rallied to $42, and closed at $42.

Exchequer was largely dealt in within a range of $12½@$9, closing at $10¼.

Daney was sold at $14@$16. Baltimore American sold at $10@$11. Sierra Nevada sold at $9½@8¼.

The aggregate recorded sales of Stocks since Saturday last, were $1,121,657.

Commencement of Twelfth Volume

—OF THE—

Mining and Scientific Press

Published Every Saturday.

The title of our journal is a truthful expression of its character.

It affords a class of progressive information to the Miners, Mechanics and Professional Men of the Pacific Coast, which cannot be derived from books, or other publications.

Each Volume comprises, in reality, a book of new intelligence and facts relating to Mining, Mechanism, Metallurgy, Science and Art, developed by our rich and peculiar resources, and identical with our own industry and history.

By the encouragement of intelligent economy in LABOR and GOLD-SAVING, we shall make the PRESS a source of INDIVIDUAL PROFIT to its patrons, as well as a public benefit to every local community in which it circulates.

The prospects of our journal are now brighter than at any former period. Our facilities for furnishing a valuable paper are constantly increasing.

Following are some of the many opinions generously expressed by our neighbors:

Editorial Expressions:

The publishers intend to make it the "Scientific American" of the Pacific Coast. Every miner should have a copy of it in his cabin, for it will be filled with useful information to the pick and shovel fraternity.—[Trinity Journal.

Should be taken by every man owning "feet" [and brains] in this State.—[Beacon.

In no other tea journals can the reader find the same amount of reliable mining news as in the PRESS.—[Contra Costa Gazette.

Every stockholder in different mines will find it will pay to take and read this mining journal.—[Contra Costa Gazette.

The PRESS is to the Pacific Coast what the "Scientific American" is on the Atlantic. It deserves its success.—[Aurora Daily Times.

It is fully up to the times, and furnishes the latest mining improvements and intelligence.—[Calaveras Chronicle.

Every miner should subscribe for the PRESS.—[Calaveras Chronicle.

It presents a channel through which all mining notices may be cheaply communicated into one sheet for the convenience of all stockholders.—[Mountain Messenger.

We can give our testimony that it is always replete with useful and valuable information to miners and mechanics. [Placer Herald.

It contains correspondence from different sections, giving accounts of new discoveries in gold, silver and copper, and should be taken by every person that wishes to keep well posted on the developments of our State and the Territories.—[Mountain Messenger.

With the last number is an index to the whole volume, most useful and valuable to those who keep files of that paper.—[Shasta Courier.

Prof. J. D. Whitney's address on Mining, is given entire. * * * We preserve the PRESS, and would like to have a full file.—[Napa Reporter.

The public should support the enterprise of the MINING PRESS, one of the best papers in the State, by a liberal patronage, as it is only by a system of legitimate reports that our mines can be favorably brought before men of capital below.—[Calaveras Chronicle.

Under the management of Messrs. Dewey & Co., the PRESS has been much improved in every respect. * * It deserves a liberal support.—[Virginia Union.

A good paper for this country.—[Humboldt Register, Nu.

Those who would have a good paper of this character, should subscribe now.—[Marysville Appeal.

It embraces one of the finest fields in the world, and seems to improve it. * * * It will be second to no scientific record now published on this continent.—[Los Angeles News

A neat and useful journal. One of the most presentable and useful in the State.—[Sunday Mercury.

Such a journal has been needed on the Pacific Coast. The PRESS fills the bill.—[Reese River Reveille.

A splendid paper, and should have a good list of subscribers in prosperous Grass Valley.—[G. V. National.

We receive, regularly as clock work, this exceedingly valuable and interesting journal.—[Napa Reporter.

Interesting and important to miners and Montana men. [Butte Record.

Friends pleased with our efforts in the publication of the PRESS can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our Journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

SUBSCRIPTION IN ADVANCE.

One Year, (two volumes)	$5.00
Six Months, (one volume)	3.00

☞ BOUND VOLUMES FOR SALE.☜

FOR ADVERTISING

Our terms are very reasonable. MINING COMPANIES are especially favored by our rates, and careful attention is given to the legal publication of MINING NOTICES.

Oakland Water-Cure.

APRIL 1ST, 1864, WE OPENED A HYGIENIC BOARDING House and Ladies' Health Institute in Oakland. The great advantage we have experienced since that time, in the treatment and cure of all those diseases peculiar to females, as well as those common to all, over that at San Francisco, induced us to give up the treatment of gentlemen in the city. We have accordingly removed our entire Bathing, Electro-magnetic, and Gymnastic Apparatus, which we used especially in the treatment of males, to our Health Institute across the Bay, and have found, after a trial of seven months, that gentlemen as well as lady patients recover, at our Fountain Farm Cure, one-third faster than in the city of San Francisco. The climate here is the most even and bracing to be found in the State. The grounds command a view unsurpassed in the world. The institution is furnished with an abundance of pure, soft water, from numerous springs; and we now refer to Ministers, Teachers, Lawyers, Miners, Merchants, Mechanics, Farmers, and all other worthy persons, who desire to try the advantage of the only *rational* system of medicine, the hospitalities of our Hygienic Home and Cure. Young men who have become debilitated or lost their health by excessive toil, exposure, or enervating habits, contracted through ignorance of Physical Laws, may with us find more of the encouragements they need, and means that will restore them to health, than elsewhere in California.

We claim for Water-Cure and Hygienic Medication superior advantages over all systems of drug medication in the cure of all disorders, whether acute or chronic; that it is followed by none of those debilitating diseases, such as Piles, Chronic Diarrhœa, Torpid Liver, Constipation, Intense Nervousness, Neuralgia, etc., nor those terrible Secondary Diseases, known as Varicose Swelling of the Veins, Necrosis, or Decaying of the Bones, Ulceration of the Limbs, Mercurial Rheumatism, Urethal Strictures, etc., which we well know result from the free use of mercury and other metallic drugs, together with stimulants and vegetable poisons given to overcome acute diseases.

The Oakland Water-Cure and Eye Infirmary is by far the most complete in its facilities for the cure of all diseases commonly treated in all Eastern Water Cures of any like establishment on this coast, and the only one in California conducted according to the Theory and Practice of the New York Hydropathic College. We use all forms of Warm and Cold Wet Sheet Packs, the Electro-Chemical Bath, Sitz Baths, Improved Shower Baths, Douche Baths, a Patent Spray Bath, and Magic Baths. The last named was instituted by Dr. Smith with special reference to the cure of those diseases peculiar to miners, namely: Rheumatism, Inflammatory or Chronic, Stiff Joints, Paralysis, Mercurial Lesions, and Oak Poisonings. It is a sure cure for Ague and Fever. It aids more than any other Bath we have yet used in eradicating all kinds of drugs and infectious poisons, and in the cure of all disorders induced by exposure to dampness and water, to which, absence of light and electricity, reporting metals, the malaria of rivers and low marshy grounds. Where there was a fair constitution left, even when drugs had been applied for months and years without a cure, we have, in the past seven years, treated successfully the following diseases: Chronic Inflammatory and Mercurial Rheumatism; Paralysis; Lung, Bronchial and Catarrhal Affections; Diseases of the Heart, Kidneys, Liver; Dyspepsia, Constipation, Erysipelas, Scrofula, Piles, Inflammation of the Bowels, Chronic and Acute Diarrhœa, and all diseases and weaknesses peculiar to males and females, over 300 females, several of whom had been "bed-ridden" for months and years, and all have been decidedly benefited, and with but few exceptions, returned to their homes in from two to six weeks, so far recovered as no longer to need a physician. We have never yet learned of a single instance of a relapse into their former condition.

There is not one female invalid in twenty that has been suffering from nervous debility or diseases peculiar to her sex, but can be permanently cured by spending from four to six weeks at our Cure, and at the mere cost of $100. This statement we make in confidence, from an experience of the last seven years. From the many who have been treated at our Cure, we have yet to learn of a single regret from husband or wife of the time or means they have expended in Hygienic Medication.

NEW YORK, Aug. 1, 1858.

To all whom it may concern:

This certifies, that Dr. Barlow J. Smith is a graduate of the New York Hygieo-Therapeutic College, which College has a regular Charter from the Legislature of the State of New York, and is authorized to grant Diplomas, conferring on its students all and the same privileges and immunities in relation to the practice of the Healing Art, that are conferred by the Diplomas of any Allopathic or other Medical College in the country.

Dr. Smith has also devoted much attention to Phrenology, especially in its connection with Physiology and Pathology, a portion of the time under the instruction of Fowler & Wells, of this city, and has labored successfully as a teacher and lecturer on these subjects.

R. T. TRALL,
Principal New York Hygieo-Therapeutic College.

To all whom it may concern:

I have known Dr. Barlow J. Smith, both in our office as a Student, and a practical Phrenologist in the country, and from what I know of him I can cheerfully recommend him as honest, faithful delineator of character, and as such can cheerfully recommend him to the public.

For the good of Science,
L. N. FOWLER, 308 Broadway, N. Y.

Dr. Smith spends a part of each day in San Francisco, attending to family practice and to Phrenological and Physiological examinations at his office, Room 13 Armory Hall, up stairs, corner Montgomery and Sacramento streets. Office hours from 11 A. M. to 2 P. M. Circulars sent on application. Address,

BARLOW J. SMITH, M. D.,
20v1tf San Francisco, Box 473.

EXCELSIOR DOUBLE ACTING Suction and Force Pump.

W. D. Hooker's Patent, August 15, 1865.

THE SUBSCRIBERS OFFER FOR SALE the following sizes of the above-named celebrated Pump, acknowledged to be the best Double Acting Pump known to be in use. They are more easily set in position, and are more durable and compact than any other Double Acting Force Pump; they are also worked with very little friction, and have greater forcing power than other pumps of like size. They are adapted to work by hand, wind-mill, horse, or steam-power.

No. 1—Cylinder 2¾ in., stroke 6 in.
No. 2—Cylinder 3 in., stroke 7 in.
No. 3—Cylinder 4 in., stroke 10 in.
No. 4—Cylinder 5 in., stroke 15 in.
No. 5—Cylinder 6 in., stroke 18 in.
The Nos. 4 and 5 are Mining Pumps.

We have also for sale a full assortment of Pump Fixtures, such as Iron Pipe, Hose, Brass Goods, etc.

J. W. BRITTAN & CO.,
12v12-3m 120 Front street,

PAGE'S PATENT —FOR— RAISING SUNKEN VESSELS!

SHIPPING AND INSURANCE COMPANIES, and other parties upon this coast or in the Atlantic States, having occasion to avail themselves of this invention, which has been tried, and proved a success, will please address, for the present, JOSEPH DEVINNEY, 1528 Stockton street, San Francisco.

AUSTIN Z. PAGE,
12v12-tf Patentee.

Mining Summary.

CALIFORNIA.

ALPINE.—New and important developments have been recently made in the Morning Star claim, Great Mogul district, and in the Buckeye No. 2, at Scandinavian Cañon, of which we find the following account in the Silver Mountain *Bulletin* of March 17th:

Great Mogul District, Alpine Co.—Johnny Bull must have been reaping a rich harvest from the stockholders of the Morning Star company, (located in the above named district,) during the past summer and autumn, as a large amount of their ore was hauled to San Francisco during that time and sold to an agent of a Swansea (Wales) firm, for, we believe, $105 per ton delivered at San Francisco. Latterly, the stockholders becoming satisfied that the ore was worth more, sent a few weeks ago a quantity of the "black ore" from their mine to the Yellow Jacket mill, in Nevada, and the following is the return per ton:

Silver per ton,	$420 61
Gold " "	303 04
Copper " "	78 33
	$801 98

It would appear that our Swansea friends were having a very good thing if they could only have kept it—the copper alone yielding a percentage double that of our best copper mines in this State. There are two distinct characters of ore found in this celebrated mine; the ore designated the "black ore," which has all the density and weight of iron ore, presents a solid mass of mineral, there being little or no rock intermixed; this is the ore that has been lately shipped to England, and the same as worked at the Yellow Jacket mill; the other variety has all the appearance of the yellow copper ores, the value of which has not as yet been ascertained, owing to its impracticable nature—none of the present appliances used in working silver ores having as yet been able to separate the base from the precious metals contained therein. We learn that it is the intention of the company to have the next working at the Yellow Jacket mill made up of a mixture of the two ores, and if a successful result is obtained, to erect a similar mill at the mine.

Buckeye No. 2—Scandinavian Canon.—On Saturday evening last a report got afloat that this company had struck a "big thing" in their claim, which is located at the source of Scandinavian Cañon, about two and a half miles from town. The first location on this lode was made by the Lady Franklin company. The Buckeye No. 2 being a northern extension on the same lode. We paid a visit to the claim on Wednesday, and after entering the tunnel for 140 feet, found as well defined a ledge full six feet in thickness as we ever witnessed. We learned from F. Mauk, Esq., the superintendent, that they struck the ledge some weeks since, but had kept things close, in order to test the ledge thoroughly, before making it public. Since first striking the ledge they have taken out about fifty tons of as rich ore as can be produced from any mine this side of Montana, without assorting. There seems to be but very little difference, as to quality, in the whole thickness of the vein, every piece of the ore being thickly studded with ruby silver. No estimate of a yield of less than $100 per ton has been made by those who have examined the ore taken out, but as it contains sulphur, antimony and copper, roasting will have to precede the crushing and amalgamating, we shall have to await a working return, until we have more milling facilities than we have at present. The ledge at the point cut is only about sixty feet from the surface croppings, but even at this superficial depth, presents a solidity not found in other ledges hundreds of feet deeper. Other mines here are also doing finely, and the citizens of Alpine are very jubilant over these rich and flattering prospects.

HUMBOLDT.—There is some excitement in Humboldt county over the reported recent discovery of a rich silver district at Black Rock. The *Sage Brush*, published at Susanville, speaks as follows of the new diggings:

Judge Harvey immediately dispatched specimens of rock to C. Isenbeck, assayer and copper smelter, resident in Genesee District, Plumas county, and taking other specimens, went in person to Unionville, Nevada, for tests. Results of assays from rock taken to Humboldt by the Judge range from a trace of silver to $418 per ton, and returns from Isenbeck show $85, $285, $650, $2,400.03, $2,100.76c, $2,100 84, $3,300.65, $3 800.37. Many other assays have been had from Isenbeck, and nearly every return justifies the belief of the discovery of a mining district unrivaled or unequaled in the history of mines.

Since the establishment of the Hardin District, Judge Harvey's camp has been unbroken, and all visitants are outspoken of his hospitality and kindness.

About two weeks since Mr. Isenbeck made his appearance in our town. He is now in the employ of the Harvey company, and has gone to Black Rock. Recent information from Judge Harvey and persons having returned from Black Rock, report Mr. Isenbeck highly pleased, pronouncing it the richest discovery of the age.

Throughout the country the rumor has gone, and almost every portion of our country is represented in the mines.

We can no longer doubt. Too many evidences have been furnished us of the value of this district, and drifting along with the current of events, we have our visions of wealth, prosperity and happiness.

We find in another paper the following somewhat extraordinary statement regarding the ores from this district:

The ore is said to be of a peculiar character. Specimens sent to San Francisco and Marysville for assay are sometimes returned to *contain not a trace* of gold and silver, but which *yield largely by working process.*

If the last statement is true, we agree in the opinion that either the ore or the assayer is probably of a "peculiar character."

CALAVERAS COUNTY.—The following we find in the Copperopolis *Courier* of March 24:

The strike recently made in the new shaft of the Keystone claim bids fair to be an important one. In the bottom of the shaft, which is about fourteen feet in depth, is a handsome lead about two feet wide. The lead is widening materially toward the northwest, and may lead to a large and valuable deposit of ore.

Meader & Co. shipped from Stockton, March 19th, 43,420 pounds Union copper ore; March 20th, 20,130 pounds

PLACER COUNTY.—The recent discovery of a gold-bearing quartz ledge, near Colfax, is causing something of a mining excitement in that vicinity. We have seen some of the rock, and would be content to own the lead, if it turns out much more of the same sort. Its richness was manifest without the aid of a glass.—*Placer Herald.*

NEVADA COUNTY.—A gentleman lately down from Meadow Lake informs us, says the Nevada *Gazette*, that times are quite dull there at present, but everybody is expecting a grand rush and flush times as the season advances. If the weather holds moderate, it is expected that the main roads will be open about the middle of April. The owners of building lots in the town hold them at about the same price as last fall, though little is doing in the real estate line now. The Winton mill is running regularly on rock from the Pacific ledge. The first lot crushed yielded $56 a ton; the second lot, $65.—*Marysville Appeal, March 23.*

GRASS VALLEY.—Since the starting of the new mill on the Lone mine, Mr. Hunt, the superintendent of the company, has had the shaft sunk some twenty feet deeper, passing entirely through the vein, which proves to be nearly three feet thick, revealing an almost inexhaustible supply of rock which will go from eighty to a hundred dollars to the ton.—*Grass Valley Union.*

A Rich Strike.—Mr. Rosenberg, a miner on Wood's Ravine, has struck a smashing rich streak of nearly pure gold, mixed with decomposed quartz and ochre. The only machinery used is a hand mortar, and with it some $6,000 have been taken out since the first of the year. So says the Grass Valley *Union.*

THE Grass Valley *National* of the 26th says:

Long Tom Mines.—Mr. L. A. Clarke returned from the above mines on Saturday. Mr. Clarke has been in the employ of G. D. Roberts & Co., working on a quartz ledge. The company put a shaft down one hundred feet, from which a level forty-five feet was run due south on the ledge. The ledge is from six to eight feet thick—never less than six feet. A ten-stamp mill has been erected, and was started about the 22d of February. The rock is easy to work, and will pay $60 per ton. In eight days run, 104 pounds of amalgam were cleaned up. Mr. Clarke is much pleased with the mineral prospects of that portion of California, and will return in a short time. In his opinion, G. D. Roberts & Co. have the biggest thing on this coast. Phil. T. Colby, recently of this place, is living at Havilah, near the Long Tom mines, where he has been elected District Recorder by the miners. Ex-Governor Wm. Bigler, of Pennsylvania, and J. C. Birdseye, of Nevada City, are now putting up a twenty-stamp mill at the latter place, W. W. Boston, of this place, having the contract for the work.

MARIPOSA COUNTY.—Two hundred and ninety bars, or pigs, of smelted copper, brought from Phillips & Haskell's smelting furnace, on the Buchanan lead, at the head of Chowchilla creek, Mariposa county, is now at the store of J. Pache & Co., commission merchants, Levee street. The lot weighs seventeen thousand six hundred and twelve pounds, and the metal assays about ninety per cent. of pure copper. A letter from the mine, received by a gentleman in this city, says that the discoveries recently made on the Buchanan lead prove it to be one of the richest mines found in the State. At a depth of sixty feet, the vein of ore is five feet wide, and the minerals of an extraordinarily rich quality. Astonishing developments will undoubtedly be made in that section of country next summer, says the Stockton *Independent.*

SIERRA COUNTY.—A correspondent of the Downieville *Messenger*, writing from Alleghany, March 11th, gives the following mining intelligence:

Mining is rather dull at present. The Masonic Company has been taking out from 150 to 160 ounces per week for some time, until last week. They had something of a cave, which was not much of a drawback, I believe. I have not heard that they cleaned up since.

Gov. Newell has returned and commenced operations with two men. We were expecting him to work fifty or sixty, as his machinery for a new mill was on the ground, and lumber and such things needed. It is reported that the Sierra Nevada Company has placed some impediment in his way, and that he intends to move his machinery. The Union Company keep their mill constantly running, and are well repaid. The Oak Flat Company are diligently at work running their tunnel, and will put a new mill up in the spring. The Twenty-one Company are waiting for good roads to open, so they can put up a new mill. The Fac-Simile tunnels are filled with water, so they cannot work to advantage for some little time to come.

VIRGINIA CITY AND VICINITY.

The accounts from the Comstock continue favorable. We give the following:

Good Ore.—The *Enterprise* of March 21st, says some exceedingly rich rock is now being taken from the deposit lately struck in the lower level of the Ophir mine. We were yesterday shown the certificate of an assay made of ore taken out across the whole face of a gallery twelve feet in width which shows it to be worth $261 60 per ton. Such ore as this is hard to beat and shows that the Ophir is all right below.

The Gould & Curry company are putting in a third pump at the Bonner shaft. The two plunger pumps now in use, each twelve inches in bore, raise the water 400 feet; the new pump is a lift pump of twelve inches bore and goes down below the plunger pumps. When the new pump is in, the company will be able to drain their mine to the depth of 800 feet. The new pump will be in operation in a few days. One engine will work the three pumps.

We find the following in the *Enterprise* of the 23d and 24th inst: We understand that the Globe company had yesterday drifted into the lead lately struck by them to the distance of thirteen feet, and were not yet through it. It is said that the assays run from $40 to $60. This, we think, is too much of a good thing. If the ore found will mill $30, the owners of the Globe have made their fortunes. We are very sure that the stockholders do not wish anything said about their mine but what is true. As yet there is no use in making a big blow over the strike, as it is not known what the ore will pay in the mills.

The Gould & Curry company are taking out daily about 200 tons of ore through their upper or D street tunnel. The ore comes from near the surface, and is very profitable to the company, as it costs a mere trifle for mining. This has nothing to do with the lower levels, from which the usual daily amount of ore is being taken.

The McClellan company, on Cedar Hill near the works of the Sierra Nevada company, are taking ore for crushing. It is thought that the rock coming out will pay handsomely.

Still Giving Out.—Our mines are still giving out silver bricks. Yesterday morning, bars to the value of $64,361 68 were shipped from this city. This is pretty good for one day. All our leading mines are at present yielding large amounts of excellent ore. Washoe is bound to come out all right yet. It is now satisfactorily proven that we have just as rich ores in the lower levels of our mines as has ever been found above. Our mills are all busy, and the chances are that we will see times lively hereabouts soon.

BULLION.—Wells, Fargo & Co. yesterday morning shipped from their office, in this city, 2,210 pounds of silver bullion, valued at $64,361 68; and from their Gold Hill office they shipped 195 pounds of bullion, valued at $5,950 43. The amount of crude bullion received for assay yesterday was as follows: Theall & Co., of this city, 2,509 ounces; Van Wyck & Co., of this city, 3,550 ounces; Leopold Kuh, of this city, 2,750 ounces; Edwards & Wiegand, Gold Hill, 3,688 ounces.

RICH ORE.—The *Enterprise* says: "We have seen a number of specimens of quartz rock of a white color, that were completely studded with free gold. The exact locality from which these specimens came is kept a secret, though the lead is said to be within thirty miles of Excelsior. If the lead contains much such rock as that exhibited to us, its owners can make all the money they want by a few months' work with hand mortars. We only want a ton of the nasty, lousy stuff.

"Specimens of two or three varieties of ore from the Blackrock country, about which the Honey Lake people have been so much excited, arrived in this city yesterday. Most of the specimens looked to us more like clay than ore. As they are to be assayed, we shall shortly learn about their value.

"Some Mexicans are said to have struck a lead of exceedingly rich gold bearing quartz in what is known as Lone Mountain, somewhere in the southern part of the Reese River country. They are going to work upon their claims with arastras."

[From the California Youth's Companion.]

JUVENILE SMOKERS.

We never look upon a group of juvenile smokers, or even see a single boy from ten to twelve years of age, with a lighted cigar in his mouth, without a feeling of uneasiness with regard to the future condition of that boy's manhood. Smoking is universally considered injurious to health, especially when practiced by very young people, and before the constitution has become sufficiently established to withstand such an unnatural attack upon it as is produced by the habit of smoking. We believe that medical men almost, or quite universally agree that tobacco, in any form, is a slow poison to the human system. It is true there are those who have escaped any serious inconvenience from its effects; but that that number is small. Tobacco may perhaps be advantageously used, under certain rare circumstances as a medicine; but we think it would be difficult, if not impossible, to find a single instance where no evil effects have followed its excessive use.

The taste for tobacco is not a natural one; it is something artificial and acquired. The instinct of brutes, ever prompts them to reject it. Taking reason for his guide, man would never indulge in its habitual use. Reader, if you are a smoker, do you recollect with what difficulty you formed the habit—how sick it made you at first; how pale you became; what nausea it produced! Do you think that since you have become accustomed to it, your system is any more naturally inclined to submit to its effects? If you do think so, you are very much mistaken. The natural system abhors it as much now as ever. You have vitiated your system, and by so doing rendered it insensible to its immediate effects. You have done precisely what the arsenic eaters do, who gradually accustom their bodies to the stimulating effects of that deadly poison, until they every day take into their system, without any perceptible harm, as much of the poison as would at first have destroyed life; but it never fails to shorten that life, and gradually break down the system. It is the same, though in less degree, with tobacco.

But there is another view of this habit—it has a moral as well as physical character. The habit of smoking, when indulged at a very early age, seldom, if ever, fails to act unfavorably upon both the intellectual state and moral character of the devotee. It has a direct tendency to repress intellectual energy, rendering its votaries indisposed to mental exertion. This every smoker admits. It produces a sort of drowsiness that is generally fascinating to the smoker. Does he ever think that this is merely another form of the terrible nausea which he first felt? Yet such is the fact, and it is precisely the first stages into which a person is driven when insanity is gradually taking possession of his brain!

TENNESSEE is showing up great mineral wealth. Near Cleveland is one of the largest copper mines in the world. Iron ore, tin, coal, marble, rock crystals, gypsum, paints, salts, and nitrous earths abound in the eastern section of the State. Gold has been found near the Georgia line. The whole section of country along the Nashville and Chattanooga railroad exhibits unmistakable evidences of petroleum. A flowing oil well has been struck near Tullahoma.

Important to Secretaries.

The following Act (introduced by Senator Robinson) was approved March 26th, 1866, taking effect immediately from that date :

AN ACT CONCERNING ASSESSMENTS UPON THE STOCK OF CORPORATIONS.

The People of the State of California, represented in Senate and Assembly, do enact as follows :

SECTION 1. The Trustees of any corporation, formed under the general laws of this State, shall have power to levy and collect, for the purpose of paying the proper and legal expenses of such corporation, assessments upon the capital stock thereof, in the manner and form and to the extent hereinafter provided, and not otherwise.

SEC. 2. No one assessment shall exceed five per cent. of the stated amount of the capital stock of the corporation, named in the articles of incorporation, and none shall be levied while any portion of any previous assessment shall remain unpaid, or uncollected, except in cases where all the powers of the corporation shall have been exercised in accordance with the terms of this act, for the purpose of collecting such previous assessment, and except, also, the collection of a previous assessment against one or more stockholders, restrained by injunction or otherwise ; in which case, further assessment may be levied and collected according to this act.

SEC. 3. No assessment shall be levied except by order of the Board of Trustees, concurred in by a majority of said Board, and entered upon the records of the corporation.

SEC. 4. Every order levying an assessment shall specify the amount thereof and the time when the person or persons to whom and the place or places where the same is payable. It shall also appoint a day subsequent to the full term of publication of the assessment notice on which the stock upon which assessments remain unpaid shall be deemed delinquent, which said day shall not be less than thirty, nor more than sixty days, from the time of the making of the said order levying the assessment, and a day for the sale of delinquent stock, which shall not be less than fifteen, nor more than sixty days from the time appointed for declaring said stock delinquent.

SEC. 5. Upon the making of such an order, the Secretary shall cause to be published immediately a notice thereof in the following form :

"[Name in full.] [Location of works.] Notice is hereby given that at a meeting of the Trustees of said Company, held on the [date], an assessment of [amount] per share was levied upon the capital stock of said Company, payable [when, to whom, and where, particularly]. Any stock upon which said assessment shall remain unpaid on the [day fixed] shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on the [day appointed], to pay the delinquent assessment, together with costs of advertising and expenses of the sale. [Signature of the Secretary, with particular location of office.]"

SEC. 6. Said notice shall be published once each week for four successive weeks in some daily or weekly paper published at the place designated in the articles of corporation as the principal place of business of the corporation, and also in some paper published in the county in which the works of the corporation are situated, if a paper be published therein : *provided*, that if the works of the corporation are not situated within some State or Territory of the United States, then publication in a paper of the County shall not be necessary ; *provided, also*, that if there is no newspaper published at the place designated as the principal place of business of the corporation, then the publication shall be made in the newspaper published nearest thereto ; and *provided, also*, that the notice specified in the 5th section of this act may be served by delivering a copy thereof, certified by the Secretary, to each stockholder personally, and in case of such service upon all the stockholders of said corporation, then no notice by publication shall be necessary, and such personal notice shall be deemed complete.

SEC. 7. If any portion of the assessment mentioned in said notice shall remain unpaid on the day specified therein for declaring the stock delinquent, the secretary shall, unless otherwise ordered by the Board of Trustees, cause to be published in the same papers in which the notice provided for in Sec. 5 shall have been published, a notice substantially in the following form :

"[Name in full. Location of works.] *Notice.* —There is delinquent upon the following described stock, on account of assessment levied on the [date,] [and assessments levied previous thereto, if any,] the several amounts set opposite the names of the respective shareholders, as follows : [Names, number of certificate, number of shares, amount.] And in accordance with law, [and an order of the Board of Trustees, made on the [date,] if any such order shall have been made,] so many shares of each parcel of said stock as may be necessary, will be sold at the [particular place,] on the [date] at [the hour] of said day, to pay said delinquent assessments thereon, together with costs of advertising and expenses of the sale. [Name of Secretary, with particular location of office.]

SEC. 8. Said last named notice shall state every certificate of stock with the number of shares which it represents, and the amount due thereon, separately, except where certificates may not have been issued to parties entitled thereto, in which case the number of shares and amount due thereon, together with the fact that the certificates for such shares have not been issued shall be stated.

SEC. 9. Said notice, when published in a daily or weekly paper, or in both, shall be published as follows : When published in a daily paper, the same shall be published for a period of ten days, excluding Sundays and holidays, previous to the day of sale. When published in a weekly paper, the same shall be published for two weeks previous to the day of sale. The first publication of all delinquent sales shall be at least fifteen days prior to the day of sale.

SEC. 10. By the publication of the said notices, as hereinbefore provided, the corporation shall acquire jurisdiction to sell and convey a full, complete, perfect, and absolute title to all of the stock described in the notice of sale upon which any portion of the assessment or costs of advertising shall remain unpaid at the hour appointed for the sale, but shall sell no more of such stock than is necessary to pay the assessments due and cost of sale.

SEC. 11. On the day and at the place, and as nearly as may be at the hour appointed in the notice of sale, the Secretary, who is hereby fully empowered and authorized, shall, unless otherwise ordered by the Board of Trustees, sell, or cause to be sold at public auction, to the highest bidder for cash, so many shares of each parcel of said described stock as may be necessary to pay the assessment and charges thereon, according to the terms of said notice of sale ; *provided*, that if payment be made before the time fixed for sale, the party paying shall only be required to pay the actual cost of advertising.

SEC. 12. The person offering at such sale to pay the assessment and costs for the smallest number of shares, or fraction of a share, shall be deemed the highest bidder.

SEC. 13. If, at the sale of any stock under the foregoing provisions of this Act, no bidder shall offer to take and purchase the same for the amount of the assessments, and costs and charges then due upon the same, then and in such case the same may be purchased and bid in by the company or corporation, through the Secretary or President, or any Director or Trustee thereof, at a sum equal to the amount of the assessments, costs, and charges due upon the same ; and in pursuance and by virtue of such purchase, the said assessments, costs and charges, shall be credited, as satisfied and paid in full, on the books of such corporation, and entry of the transfer of such stock to such corporation, in pursuance of such sale and purchase, shall be made on the books of said corporation. While such stock shall remain the property of such corporation, the same shall not be assessable, nor shall any dividends be declared upon the same ; but all assessments and dividends shall be apportioned upon and against the other stock of such company not owned by such corporation. All purchases of its own stock made by any corporation, in accordance with the provisions of this section, shall be held valid, and as vesting the legal title to the same in said corporation ; and the stock so purchased shall be held subject to the control of the remaining stockholders, who may make such disposition of the same as they may deem fit, in accordance with the by-laws of the corporation or vote of a majority of all the remaining shares. Whenever any portion of the capital stock of any corporation is held by the said incorporation by purchase as aforesaid, a majority of the remaining shares of stock in said corporation shall be held to be a majority of the shares of the stock in said corporate company for all purpose of election or voting on any question before a stockholders' meeting.

SEC. 14. The times or dates fixed in any notice of assessment or notice of delinquent sale, published according to the provisions of this act, may be once extended for a period of not more than thirty days, by order of the Board of Trustees, duly made and entered on the records of the corporation, but no order for extending the time for the performance of any act specified in any notice shall be effectual unless notice of such extension or postponement be appended to and published with the notice to which [the] order relates.

SEC. 15. No assessment duly levied shall be rendered invalid by a failure to make proper publication of the notices hereinbefore provided for, nor by the non-performance of any act required to be performed in order to enforce the payment of the same ; but in case of any substantial error or omission in the course of proceedings for collection, all previous proceedings, except the levying of the assessment, shall be void, and publication shall be begun anew.

SEC. 16. No action shall be sustained to recover any stock, or invalidate the sale of any stock for delinquent assessments, upon the ground of any irregularity in making the assessment, or for any irregularity in or defect of the notice of such sale, or for any defect or irregularity in the sale, unless the party seeking to maintain such action shall first pay or tender *to the corporation or the party holding such stock so sold*, the sum for which the same was sold, together with all subsequent assessments which may have been paid thereon, and interest on such sums from the time they were paid ; and no such action shall be sustained unless the same shall be commenced by the filing of a complaint and the issuance of a summons thereon within six months after such sale shall have been made.

SEC. 17. "An Act Concerning Assessments upon the Stock of Corporations," approved April 4th, 1864, and all Acts and parts of Acts, inconsistent with the provisions of this Act, are hereby repealed ; *provided*, that such repeal shall not affect proceedings commenced for the collection of assessments heretofore levied, but all such assessments may be collected in accordance with the provisions of the laws then in force.

SEC. 18. This Act shall take effect immediately.

THE FIRST AMERICAN POETRY.—There are few girls or boys in this country who have not heard the nursery rhyme sung by their mother while rocking the cradle :

"Lull-a-by baby upon the tree top;
When the wind blows the cradle will rock;
When the bough breaks the cradle will fall,
And down will come cradle, baby and all."

But how many of you know the origin of the simple lines? We have the following account from the records of the Boston Historical Society : Shortly after our forefathers landed at Plymouth, Massuchusetts, a party were out in the field where the Indian women were picking strawberries. Several of these women, or squaws, as they were called, had *papooses*—that is, babies—and having no cradles, they had them tied up in Indian fashion, and hung from the limbs of the surrounding trees. Sure enough, "when the wind blew these cradles would rock." A young man of the party, observing this, peeled off a piece of bark, and wrote the above lines, which, it is believed, is the first poetry written in America.

COFFEE.—It is somewhat singular to trace the manner in which arose the use of the common beverage of coffee, without which few persons in any half or wholly civilized country in the world now make a breakfast. At the time Columbus discovered America, it had never been known or used. It only grew in Arabia, or upper Ethiopia. The discovery of its use as a beverage is ascribed to the superior of a monastary in Arabia, who, desirous of preventing the good monks from sleeping at the nocturnal services, made them drink the infusion of coffee, upon the report of shepherds, who observed that their flocks were more lively after browsing on the fruit of that plant. Its reputation spread through the adjacent countries, and in about 200 years it had reached Paris. A single plant brought there in 1714 became the parent stock of all the French coffee plantations in the West Indies. The extent of the consumption now can hardly be realized. The United States alone annually consume it at the cost on its landing of from fifteen to sixteen millions of dollars. You may know the Arabian or Mocha, the best coffee, by its being of a dark yellow color. The Java and East Indian, next in quality, are larger and of a paler yellow. The West India Rio has a blueish or greenish gray tint.

COINCIDENCE.—It happened a few days since, that three steamers were going out of the Gate almost simultaneously, and met a fourth just off the Heads. They were, the opposition steamer America, for San Juan, the steamers Pacific and Montana for Portland, and the Sierra Nevada coming in. The usual salutes were duly exchanged by the steamers. Such a sight is seldom witnessed in the largest commercial ports in the world.

CURIOUS FACT.—There is a curious fact concerning the Lincoln medals struck for the great sanitary fair at Chicago. The die cracked in the making, and the line it left marks the exact course of the bullet which took President Lincoln's life.

AN almost incredible story is told of a telegraph operator in Washington, to the effect that he lately received two long dispatches by two different instruments simultaneously, interpreted them both by sound, and wrote them out simultaneously as received, one with his right, and one with his left hand.

BOYS are a good deal like farina jelly—just as you mould them they are likely to turn out.

1852. 1866

A NEW VOLUME.

Fourteenth Year of Publication.

THE GOLDEN ERA.

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents and contributors of distinguished ability in New York, Paris and London.

Miss BRADDON'S Greatest Sensation Story published from Advance Sheets:

RUPERT GODWIN;

—OR—

The Secret of Wilmindon Hall.

A NOVEL.

By Miss M. E. Braddon,

Author of "Lady Audley's Secret," "The Outcasts," "The Doctor's Wife," "Three Times Dead," etc.,

—IN—

THE GOLDEN ERA.

NOW IS THE TIME TO SUBSCRIBE!

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California and on the Pacific Coast, also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

"THOUGHTS AND THINGS"

APPEAR WEEKLY IN THE GOLDEN ERA.

Read "Thoughts and Things" in the GOLDEN ERA.
" Professor Clearquill," in the Golden Era.
" Dogberry," in the Golden Era.
" Alice Mason," in the Golden Era.

TO ADVERTISERS.

Best Advertising Medium.—The Golden Era is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village and mining and agricultural precinct in California, and offers unusual and unequalled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for Inventions can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

Mr. Wm. R. Bradshaw, is our Special Correspondent and Traveling Agent. All favors or assistance rendered him in his progress through the country in behalf of our journal, will be duly acknowledged.

SAN FRANCISCO, Jan 1st, 1866.

Mr. A. C. Knox, is our fully authorized Traveling Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.

SAN FRANCISCO, Jan 11th, 1866.

Mr. Elwin Davis, is authorized to solicit subscriptions, advertising, etc., for the MINING AND SCIENTIFIC PRESS, in San Francisco, and to receipt for the same.

San Francisco:
Saturday Morning, Mar. 31, 1866.

Endorsement by the Miners' State Convention.

The following resolution was adopted by the California Miners' State Convention, held at Sacramento, Jan. 17th, 1866:

Resolved, That we regard a mining paper or journal of great importance to the mining interest of California, and we recommend the MINING AND SCIENTIFIC PRESS, of San Francisco, to the consideration and support of the miners of the Pacific coast.

OUR FOUNDRIES.

Since our last issue, we have visited but one foundry, viz., the Fulton, where we found the proprietors really too busy to give us any lengthy description of the work in progress. We learned, however, that the works are now building the machinery for a steamboat for Messrs. Nelson, Anderson & Runyon, the hull of which is being constructed at the shipyard of John North. The Fulton is also turning out the machinery for a boat for Col. Bulkley, for the Russian Telegraph Expedition. Orders are on hand at this foundry for four sawmills, one quartz mill, one stationary engine, besides a great deal of general work, which forces the establishment to run day and night.

The lively aspect of business among the foundries of our city, is a strong indication of improving times over the State.

CONCENTRATORS.—We are glad to notice that more attention is being given to this economical class of machinery. Messrs. Bigelow Brothers, of this city, who have given much consideration and practice to the operation of concentratore in gold and sulphuret saving, have just ordered the third Hendy's Improved Patent Prater Concentrator for the Cony mill, in Amador county. Within a short period, there have been several more of these machines ordered in that county. Messrs. Bigelow Brothers are working successfully, and we hope they will reap a rich fortune through their active and liberal enterprise.

SMOKY CHIMNEYS are morally and socially unhealthy, if not physically so; consequently, every well regulated institution should guard against them. One of the most successful remedies for smoky chimneys with which we have yet become conversant, is the patent chimney top of B. A. Henriksen, advertised in another portion of this paper. It is an article worthy of examination. Patent rights are offered for sale. We understand the inventor has also a very ingenious pump, which is attracting much attention.

QUARTZ MILLS.

In crushing ore, the first point is to pulverize it to the desired fineness with the least possible power, then to avoid waste of power, and then economy of construction and maintaining in order. As combining these principles we have always contended, as have the ablest miners of the world generally, that the stamp did it with as near an approach to perfection as possible, and it had demonstrated its adaptability to the purpose by many centuries of faithful trial. We had looked for improved methods of operating stamps, but doubted the possibility of their displacement. A stamp is lifted, is then loosened, and falls upon the ore to be crushed. If the die holding the ore solid, clean, and contains just the amount of ore the stamp can crush, for this blow it appears to make use of all the power expended in lifting it; but to keep up the full effective power, these conditions of a solid, clean and true die, or mortar, and the maximum of ore that can be crushed, must all be continuous. These conditions will not result from the operations of a set of stamps, and are therefore impossible. A stamp, particularly in dry crushing, may often strike upon a body of ore already crushed, or mixed with that which is fine enough and thus waste a blow, or it may strike upon the naked die, and there are many other conditions well known to millmen where the effectiveness of stamps is lost. Some men are much more skillful feeders than others, simple as it may appear to shovel rock into a battery, and those with taste for music are preferred as they can judge best by the sound how the stamps are working, and therefore "the music of the stamps" is a truthful as well as poetic expression. Such are the defects of the plain, effective, and venerable stamp. In operating with stamps, the lifting and dropping of such heavy bodies of iron, necessitates the construction of a very costly frame work and bed, the aim of which is solidity, and from the nature of the operation, the jarring of loose iron, it is almost impossible to maintain solidity for any great length of time. A battery of stamps is cumbrous, noisy, and disagreeable in managing, of very costly construction, and expensive to operate and maintain, but with all the defects we have observed, they are to this day the favorite with the great majority of miners, and are in almost universal use wherever mining operations are carried on. * * *

We have examined the operation of a new invention called "Gardiner's Thunderbolt Crusher," which obviates the defects we have mentioned of the stamps. The one to which we refer is in operation at the Coral and Aspinwall mill at Amador, a few miles north of this city, and which was inaugurated with the honors on Saturday last. The machine is an improvement on stamps as the nut cracker is an improvement on the hammer and anvil at table. The invention consists in a pair of moveable, nearly upright jaws, with crushing surfaces of about two feet square having arms which rise about three feet and are connected with a crank shaft having two short cranks reaching opposite ways, so that in the revolution of the shaft the two crushing plates move from and towards each other simultaneously. One of the peculiar features of the invention is the relative axes of the two crushing plates. One of these is from the synchial axis, or place of contact of the two plates, six inches, and the plate is cast with a curve of six inch radius, and the other is eighteen inches from the same line and is cast with a curve of a radius of eighteen inches. The plates are flat with the exception of the narrow strip at the lower portion of closest contact, where they are of the curves mentioned, and being of white, chilled iron will not be worn out in many month's use. Strong steel bars pass through the block on which the crushers rest, and hold screws by which the crushers are adjusted, or gauged to any fineness or drawn together in case of wear. The whole is in a strong cast iron frame, above five feet in hight, four feet in width, and about eight feet in length. This is bolted to a well anchored floor and occupies a space of about eight by ten feet. Through the floor is an aperture where the crushed ore passes into moveable screens or seives which, in this case, have twelve hundred holes to the square inch. The screen is moved by an arm attached to one of the jaws of the crusher. In the operation we witnessed, one ton of ore, generally in pieces of several pounds' weight, was crushed with apparent ease, without noise, jar, or dust, and very effectually in just forty-six minutes, the power used being a small Little Giant engine and boiler of 25-horse power, running with sixty-five pounds of steam. The boiler and engine are a late invention, and constitute a very compact, economical, and effective machine, occupying about the same space as the crusher, and all look as if they could be taken up and carried away as easily as the stove, and the butter churn one would find in a farmer's kitchen; but we never carried away a hot stove, and do not know how easily it could be done. The crusher appears to do its work without waste of power, and without destruction to the machinery. It takes a piece of rock in its jaws and comes together with the regular power of the engine and the accumulated power the driving wheel has gathered in opening them, crushes the rock, part of which is fine enough to fall through, and is not in the way again; the balance falls to where it will be crushed finer the next time the jaws come together, or to where the abrading motion takes place given by the unequal distances of center of movement of the two plates. That at the trial the machine did so much work so easily, quietly and effectually; that it occupies so little room; is not liable to get out of order, and withal can be constructed so cheaply shows a manifest superiority over stamps and promises to supersede them.—*Reese River Reveille.*

REMARKS.—From the above description of the machine in question, it will be seen that its main principle is closely allied to that of "Blake's Crusher," though the mechanism is somewhat different, and it involves in addition to this the attempt (of doubtful utility) to combine, in the manner described, a *grinding* with a crushing motion.

We have heard something of this machine already, and, if we are correctly informed, the history of its development and experimental trials in New York city, has been by no means as satisfactory as might have been desired.

The impression conveyed by the preceding notice, is certainly a very flattering one. But there are one or two important points in the 'operation witnessed," which the writer has neglected to state, and which require elucidation, viz: How hard was the ore, of which one ton was crushed "in just forty-six minutes"—and *what was the degree of fineness of the crushing?* How much of the crushed ore would *pass through* a seive having "twelve hundred holes to the square inch"—or, through what size of mesh would the whole of it have passed? Another question of no less practical importance relates to the durability of the machine. How long will it last, and how often and to what extent will it need repairs and adjustments in order to secure the requisite quality and *uniformity* of work under conditions similar to those above? It is idle to suppose that "white chilled," or any other iron, can resist for "many months" the action to which it must be subjected in a machine like this, in order to crush hard quartz to the degree of fineness requisite for amalgamating purposes, at the rate of a ton in forty-six minutes. Quartz is *hard*, and in such a machine, with *fine* and *rapid* crushing, (if the thing can accomplish this at all), the wear of the jaws must be correspondingly rapid, and the machine need frequent adjustment. Moreover, any inequalities in hardness in the iron of the jaws would produce inequalities in their rate of wear, and these in turn, in spite of any possible adjustments, would produce inequalities in the fineness of the crushing.

While, then, we are by no means inclined to consider stamps as the *ne plus ultra* of crushing apparatus, and while we heartily wish success to those who try to devise a better means, we are nevertheless unacquainted as yet with anything that, on the whole, can supply their place, and we certainly do not think, judging from the foregoing description, that the invention in question is destined to revolutionize the quartz mills of the Pacific Coast.

LEGISLATIVE.—The bill regulating miners' measurement of water was indefinitely postponed in the Senate on Friday. Act to establish a Mining, Agricultural and Mechanic Arts' College had its final passage in the Senate, by 29 to 5. The session expires by limitation on Monday next, April 2d. A large number of bills are still on file. Mr. Singleton's Assembly bill concerning mining copartnerships, we believe, has finally passed. It is an important Act, and if it becomes a law, will create a sweeping revolution in the operations of unincorporated mining companies.

LEGISLATIVE FAVORS.—We are under obligations to the Hon. E. L. Smith, Chairman of the Committee on Mines and Mining in the Assembly, for copies of many valuable public documents.

PRESIDENT JOHNSON is 57 years old.

NEW BOOKS.

NEW BOOK.—We have been presented by the Pacific Publishing Company, No. 305 Montgomery street, with a copy of the "Trial of the Conspirators in the Assassination of the Late President Lincoln," which contains a fine steel engraving of the portraits of the assassins, the pursuit and capture of Booth and Harrold, together with all the evidence and testimony concerning the same; the celebrated Lon Letters, Ben. Wood Draft, Introduction of Pestilence, as well as all the minute incidents of the trials and executions, together with the *verbatim* report of the masterly arguments of the counsel for and against the conspirators, including that of the Honorable Reverdy Johnson. The whole work presents a book of over 400 pages, neatly bound, and is sold only by subscription, and must afford a good ready reference as well as present reading.

VALUABLE METALLURGICAL WORK.—We acknowledge the receipt of a catalogue of practical and scientific books, with a copy of Makin's Manual of Metallurgy, from Henry Carey Baird, Industrial Publisher, No. 406 Walnut street, Philadelphia, which contains the general properties of metals, their specific gravity, malleability, ductility, and tenacity, as well as their alloys. It also treats of non-metallic elements, metallic salts, giving sure rules for tests in a clear, simple, and succinct manner, with many illustrations; also, of metallurgical operations, furnaces for smelting and reducing ores, and of the fuels and heat applicable thereto, together with the principles of electro-metallurgy. This book contains over four hundred pages, 8vo., and seems to us to be a valuable one to the miner, whether engaged in the mill or prospecting in the mountains.

STRATMAN'S ALMANAC, FOR 1866.—We acknowledge the receipt of a copy of the Leslie-Stratman Almanac, with many fine illustrations of scenes and incidents. It contains a portrait of President Johnson, and a sketch of the house "where he made good clothes" in early life. The book contains sixty four pages, with a fine and life-like portrait of the handsome Major himself.

SNOW BOUND, by John Greenleaf Whittier; 56 pp., 12mo.; Tickner & Fields, Publishers, Boston.

Messrs. H. H. Bancroft & Co., No. 609 Montgomery street, have received the above work. Its truthful and graceful picture of New Eagland rural winter life is unmatched. Without exaggeration, with simple language, every page gleams with elegant poesy and sentiments of frankness and goodness. The book is richly printed, and will prove a little gem and keepsake to those who obtain it.

A GENERAL DIRECTORY AND BUSINESS GUIDE of the Principal Towns in the Upper Country, embracing a portion of California; together with Mining and Statistical information concerning Idaho Territory, and a Map of Idaho and Montana."

We have received a copy of the above work, whose general character is sufficiently indicated by its title, forms a neat volume of about 160 pages. The "Business Directory" contains the address of firms in all the more important towns of Oregon, and of Washington and Idaho Territories, as well as in those places of California whose situation and business relations connect them with the "Upper Country." The map is well executed, and besides Idaho and Montana, it represents in outline, Oregon, and Washington Territory, together with the northern portions of California, Nevada and Wyoming, and shows the principal routes to the new mining regions.

The part devoted to mining and statistical information is quite full, giving brief descriptions of the quartz mills, and more important mines in each district, lists of locations already recorded, with the number of feet they contain, data respecting population, table of distances, etc., etc. We recommend the book to those having business relations with the "Upper Country." The book is published by A. Gensoul, 511 Montgomery street, a fact which we omitted to mention last week.

THE San Jose *Courier* says that the people of that town frequently hear the firing of cannon in San Francisco, forty miles distant.

CONTRIBUTED FOR OUR CABINET.

Under this heading we shall continue to mention and describe according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented or forwarded to us by mail or express prepaid. Each article will be numbered and placed in our cabinet and recorded with the name of the donor, and the claim or location from whence it came.

Fine Specimen.—We have received from Mr. M. A. Woodside, of Georgetown, Placer county, a very fine specimen, taken from his claim located near the center of that town. The specimen is tolerably compact, but contains talcose streaks, through which the sulphurets (iron pyrites) are mainly distributed. The gold is chiefly in the quartz, and is quite coarse. We have quite a full description of the claim from which it was taken, in a letter from our "travelling correspondent," who writes under the signature of "Prospector." His letter appears to-day.

Lead as an Amalgamator.—We clip the following from an Eastern exchange: "William M. Fuller of Chicago, has invented a machine for amalgamating gold by means of melted lead, instead of quicksilver. The machine is constructed so that the pulverized quartz is forced through the melted lead by atmospheric pressure, and by this means it is contended that the gold is extracted more completely than by any process of amalgamation with quicksilver. A trial of the machine was lately made at Chicago, and a committee appointed to examine its practical working, made a favorable report on the result, and claimed the invention as something wonderful. It is known that melted lead will form a complete alloy with gold, and being much cheaper than quicksilver, it is not improbable that the invention of Fuller's machine may prove an era in the history of quartz mining."

We cannot present here a treatise on the metallurgy of lead and gold, and will only say that although no fact is more ancient in the history of metallurgy, and none has been longer or more widely applied in practice than the fact that lead will alloy with gold and silver, yet the absurdity of expecting economical results from the process above indicated will be evident to all who are acquainted with the metallurgy of lead, and with practical quartz mining. Any extraction of gold or silver from their ores by means of lead, that does not involve a *fusion* of the ores themselves, can be at best but very partial and incomplete, and any effective treatment of these ores by means of lead, would be quite expensive here, demanding considerable fuel, and furnaces specially adapted to the end in view, and involving loss of lead, etc.

The agency of lead may be advantageously employed with *some ores* (particularly with rich and complex silver ores *accompanied by lead ores in considerable quantity*) even on this coast; but it is not adapted for *general* use, and the particular method of applying it, described above, is still less so.

Coral and Aspinwall Mines.—We have heretofore published assays of remarkably rich rock from the Aspinwall mine, Amador District, Lander county, Nevada, and are now pleased to learn that the company are hopeful of soon reaping a good harvest. The *Reveille* of March 12th, says:—"The mill of the Coral and Aspinwall is now completed for working without roasting, is of stone walls, substantially and quite conveniently constructed, although great improvement may be made in convenience. It has ten Knox pans, which are operated by a Little Giant engine of the same pattern and power of the one working the crusher. The Coral mine is within a few yards of the mill, and at the dump are several thousand tons of ore, with which the mill will be well and constantly supplied, and under the management of Mr. Wadleigh, the very personification of energy, will soon be adding largely to our shipments of bullion."

Twenty-Seven Children Drowned.—The Dayton (Ohio) *Journal*, as we learn by telegraph, states that twenty-seven children were drowned in a reservoir at Celina, Ohio, on Wednesday, February 7th. They were attending school in the vicinity of the reservoir, and at noon all the scholars but two—twenty-seven in number—went on the ice to slide, when it broke with them, the whole party drowning before help could reach them.

Quartz Mills in Colorado.—There are at present 150 quartz mills in Colorado.

RULES

FOR

ADVERTISING ASSESSMENTS

IN ACCORDANCE WITH THE

NEW ACT CONCERNING THE ASSESSMENTS OF CORPORATIONS.

In the order levying an assessment, appoint a day when the stock shall be *deemed delinquent*, which day must not be less than *thirty* nor more than *sixty* days from the date of the meeting levying the assessment. Be careful and allow ample time for completing the necessary term for advertising the assessment notice (once a week for four weeks), at the place of business and at the mine, *previous* to the day the stock shall be *deemed delinquent*.

Also in the order levying an assessment, appoint a day for the sale of delinquent stock, which must not be less than *fifteen* nor more than *sixty* days from the day appointed for deeming the stock delinquent. In appointing the day of sale, be careful to allow ample and convenient time for advertising the delinquent list, once a week for at least two weeks, at the place of incorporation and at the mine, the first publication at each place to be subsequent to the day for deeming the stock delinquent, and at least fifteen days prior to the day of sale.

The sum due on each certificate must be stated separately, with the number of the certificate and amount of shares it contains.

The dates (or times) mentioned in any assessment notice, or sale notice, can be once extended for a period not to exceed thirty days, by order of the Board of Trustees, and by publishing the postponement with the original notice.

Sales and postponements should be published in the same papers in which the assessment notice appears.

Delinquent sales, *if published in a daily paper*, must be published every day, except Sundays and holidays, the first publication to be fifteen days prior to the day of sale.

Proofs of assessment notices or delinquent sales, for publication in the Mining and Scientific Press, will be furnished within twenty-four hours from the time of receiving the copy, and corrected printed copies will be given free for mailing to papers at mines. This will avoid errors and save Secretaries the trouble of making duplicate manuscript lists.

New Blanks for advertising will be furnished free, with copies of the New Law, and further information concerning the same, on application at our office.

DEWEY & CO., Publishers,

MINING AND SCIENTIFIC PRESS, 505 Clay St.

Siempre Vivas.—Lieut. George E. Spoor, of the 7th Reg. California Volunteers, just returned from Fort Yuma, via Cape St. Lucas, has left us a sample of this curious plant, which he obtained at the Cape. The *siempre vivas*, notwithstanding it grows wild in Mexico, is a rarity in its own soil. Let it be taken up by its roots, dried like hay, packed away for months, or transported to any part of the globe, and then placed in water, it will instantly and almost miraculously unfold itself into a beautiful green foliage. Doubtless, many of our readers have observed this species of modest little green tufts about our nursery stores, without understanding its singular powers.

Barbacoas.—The accounts received by the last Panama steamer are everything but favorable. A correspondent of the *Alta*, who has been there, states that on arriving at Barbacoas, he found that *there was but a single claim which had paid a single dollar*. Insects and reptiles of all kinds are as plenty as a rank vegetation and a tropical climate can make them. The climate itself is pestilential and deadly, and the mines are mostly *poor*. Thus end the golden stories at first received. Another bubble is burst.

Kansas.—It is said that the State Geologist of Kansas, in his report soon to be published, will place in a very strong light the mineral importance of that State. He asserts that salt springs exist in nearly every county. Salt, in pure solidified form, in a stratum two feet in thickness, is found in Republic county. The coal measures are extensive, the Osage and Cherokee veins being especially rich. Beds of gypsum have been discovered. Iron ore and tin are also found.

From Arizona.—The Arizona *Miner* of February 28th, says:

We hear that the shaft on the Vulture lode, for B. Phelps, is completed, and that at one place the lode was found to be twenty feet wide, and of rich ore. An experienced operator in mines, lately arrived here, says the United States is the best opened mine he ever saw; that in his opinion not a stroke of work has been thrown away. This is complimentary. The Sterling lode is still attracting attention but we believe no definite arrangement has been made for a mill. Now that it is known that a number of mills are on the road here, our quartz owners should be getting their lodes in a saleable shape. It is useless to expect to sell ledges for large sums without thoroughly prospecting them.

A Valuable Secret.—The *Scientific American* says:

"The unpleasant odor produced by perspiration is frequently a source of vexation to persons who are subject to it. Nothing is simpler than to remove this odor much more effectually than by the application of such unguents and perfumes as are in use. It is only necessary to procure some of the compound spirits of ammonia and place about two table-spoonsful in a basin of water. Washing the face, hands and arms with this, leaves the skin as clean, sweet and fresh as as one could wish. The wash is perfectly harmless, and very cheap. It is recommended on the authority of a physician."

Astronomical.—Those interested in the study of astronomy may find something on which to employ their genius, from the fact that during the month of January there were two full moons, the month of February was favored with nothing of the kind, and March was heralded and will expire with a couple of these matured lunar luminations. Can any of our scientific friends explain when such an event happened before, and when it will occur again

How to Preserve a Boquet.—A florist of many years experience sends the following method of preserving boquets, to the *American Artizan*:

"When you receive a boquet, sprinkle it lightly with fresh water; then put it into a vessel containing some soap suds, which nourish the roots and keep the flowers as bright as new. Take the boquet out of the suds every morning and lay it sideways in fresh water, the stock entering first into the water; keep it there a minute or two, then take it out and sprinkle the flowers lightly by the hand with pure water; replace the bequet in the suds, and the flowers will bloom as fresh as when first gathered. The soap suds need to be changed every third day. By observing these rules, a boquet can be kept bright and beautiful for at least one month, and will last longer in a very passable state; but the attention to the fair, frail creatures, as directed above, must be strictly observed, or the 'last rose of summer' will *not* be left 'blooming alone,' but will speedily perish."

The total recognized debt of the United States on the 1st instant was $2,827,868,959. Of which $1,117,807,291 bears interest in coin, $1,185,428,980 bears interest in currency, $985,979 consists of matured debt not presented for payment, and $463,586,909 is debt bearing no interest. Deducting the $116,018,959 of coin and currency then in the Treasury, would leave the debt $2,711,850,000.

Diptheria is a very troublesome and dangerous disease. A very easy remedy has been found for it that will effect a very speedy relief. Take a common tobacco pipe, place a live coal in the bowl, and drop a little tar upon the coal, draw the smoke into the mouth, and discharge it through the nostrils.

Schools in Butte.—The new and promising town of Chico has just erected a brick schoolhouse, at a cost of five thousand dollars. There are 2,117 children and in the youth county.

The largest Sunday School in the world is at Stockport, England, and numbers about 5,000 scholars. There are 300 teachers; over 2,000 of the scholars are past 16 years of age.

Artists may not be guilty of direct falsehoods, but they give things a coloring.

The Bankers of the World.—"The Merchants and Bankers' Almanac for 1866," one volume octavo, published at the Bankers' Magazine Office, N. Y., contains lists of 1,620 National Banks (with the names of President and Cashier and New York correspondent of each), 400 State Banks; 1,100 Private Bankers in the U. S; Banks and Bankers in London, Liverpool, Dublin, Edinburg, Leeds, Manchester, Birmingham, etc.,; 600 Bankers in Europe, Asia, Africa, Australia, the West Indies, South America, New Zealand, Mexico, Canada, etc.; Alphabetical list of 2,000 Cashiers in the United States; list of 300 Savings Banks in New England and New York, with the deposits of each; Bank Statistics of the United States; List of Standard Works for Bankers; prices of Iron, Copper, Coal, monthly at New York, 40 years; Daily price of Gold for four years, 1862-1865; and six engravings, viz: The New York Stock Exchange (erected 1865); 2. The Paris Stock Exchange (1808-1826); 3. The Bank of England; 4. Banking Houses, Wall Street; New Insurance Buildings, Broadway, New York; 6. The Mutual Life Insurance Company of New York. 13v12-1t

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alterations which they may desire made in their advertisements at their earliest convenience. New advertisements should be sent in as early as possible.

ELDER KNAPP, speaking of long prayers, once said: 'When Peter was endeavoring to walk upon the water to meet his Master, and was about sinking, had his supplication been as long as the introduction to one of our modern prayers, before he got through he would have been fifty feet under water.'

A YOUNG LADY, recently returned from boarding-school, being asked at table if she would have some more cabbage, replied: 'By no means, madam, gastronomical satiety admonishes me that I have arrived at the ultimate culinary deglutition consistent with the code of Esculapius.'

SCHOOL ELECTION.—At the election in Silver City, last Tuesday, the proposition to raise $2,500 for building a school-house was decided in the affirmative, and the following officers were elected: Trustees—C. A. Gross, Caspar Haupt and J. K. Barney; Assessor and Collector, Jos. Munckton.—*Dayton Sentinel.*

Trades and Manufactures.

Pacific Glass Works

Are now prepared to execute orders for the manufacture of

All Kinds of Bottles to Order.

Office, No. 621 Clay street, San Francisco. 3v11-3m

JOHN DANIEL,
(SUCCESSOR TO O. GORI)
MARBLE WORKS,
No. 408 Pine st. bet. Montgomery and Kearny, San Francisco.

Mantels, Monuments, Tombs, Plumbers' Slabs,
Etc., On hand and Manufactured to order.

☞ Goods shipped to all parts of the State. Orders respectfully solicited. 5v3-3m

NATHANIEL GRAY,
General Furnishing Undertaker,
641 Sacramento St., corner of Webb, San Francisco.

Barstow's Metallic Burial Caskets and Cases.

To Mining Companies.
A GENTLEMAN OF MUCH EXPERIENCE AS A MINING Superintendent, in England, Spain, and on the Pacific coast, and one intimately acquainted with every department of mining, and with nearly every class of mineral, is desirous of securing a position as Superintendent of some mining operation in California or Nevada. The applicant was for four years Superintendent of the New Almaden Quicksilver Mine, in this State. The best of reference given on application at this office.
San Francisco, Oct. 12, 1865 5v11tf

REMOVAL.
MONS. A. COULON,
Informs his patrons that he has removed his DRAWING SCHOOL from Pine street to
410 Kearny Street.
Drawing Classes in the Evening will take place as usual. DRAWINGS FOR PATENTS accurately and neatly done.
20v11-1m

ENGRAVER TO ORDER.—Persons who desire to illustrate their individual establishments or business, should give us their orders for Engraving and Printing, and we will guarantee good work and reasonable prices.
DEWEY & CO.,
Patent Agents, Publishers and Job Printers, 505 Clay st

Our Circulation.—THE MINING AND SCIENTIFIC PRESS has a large and permanent subscription list, and enjoys a more universal circulation among stockholders and persons directly interested in mining than any other paper on this coast.

Metallurgy.

MOSHEIMER'S CONCENTRATOR
RECEIVED THE FIRST PREMIUM
From the ROYAL POLYTECHNIC SOCIETY, in Cornwall, and was highly recommended by the Commissioners as the most Simple and Effective Concentrator for all kinds of Ores.
Every Quartz Mill ought to have them, as they not only save Gold and Silver, but also the Quicksilver and Sulphurets, without extra labor. They can be built entirely of wood at the mine, and will separate more perfectly in one operation, than any other Concentrator in use. Apply to
J. MOSHEIMER,
23v11qy 423 Washington street.

EUROPEAN
METALLURGICAL WORKS,
—AND—
Practical Mining School,
Bryant Street, Between Third and Fourth,
SAN FRANCISCO.
THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.
PRACTICAL MINING SCHOOL.
The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

BY MAIL.—The MINING AND SCIENTIFIC PRESS will be sent by mail to any part of the civilized world. In case of removal, subscribers have only to inform us of the post-office address of their old and new location, and the paper will be sent accordingly.

SEND US WORD.—If any subscriber to this journal fails to receive the same regularly and promptly, they will confer a favor by informing us at once.

THE KRAKEN.—Among the many legends and traditions concerning the monsters which were supposed to inhabit the sea, is one which still prevails to a certain extent on the coast of Norway. According to the superstition, the Norwegian fishermen often find unexpected shallows a few miles out at sea, the depth of the water suddenly diminishing from one hundred to twenty or thirty fathoms. This decrease of the depth is due to the presence of the Kraken, a terrible sea monster, and in such shallows fish are always found in abundance.—When the fishermen perceive that the water is growing shallower, they immediately beat a hasty retreat, for they know the monster is rising. His back appears first, looking like a number of small islands, and appearing to be, at the lowest calculation, at least one and a half miles in circumference. His arms rise above the surface like the masts of a vessel, and are said to have the power to grasp the largest man-of-war, and pull it to the bottom. When he sinks again, he causes a swell and whirlpool which endangers all the ships in the vicinity. This story, though now admitted by the majority of the Norwegians to be fabulous, is still believed to a great extent by the dwellers along the sea coast.

THERE is a string in every generous mind which, if touched lightly, yields fine tones; but, if struck by an unskillful hand, only produces discord.

A Business Compliment.

PETALUMA, Oct. 4, 1865.

MESSRS. DEWEY & CO.—Gentlemen: Your note informing me that my patent for Crushing and Baling Machine is ordered to issue is at hand. Please accept my thanks for the prompt and business like manner with which the case has been conducted, and inclosed find twenty dollars for balance Government fees. Respectfully, etc.

JACOB PRICE.

1852 1866

A NEW VOLUME.

Fourteenth Year of Publication.

THE GOLDEN ERA.

FOUNDED IN 1852.

The oldest weekly paper in the State, permanently established, and more widely circulated at home and abroad, than any other paper on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents and contributors of distinguished ability in New York, Paris and London.

Miss BRADDON'S greatest Sensation Story, published from advance sheets:

RUPERT GODWIN;
—OR—
THE SECRET OF WILMINDON HALL.
A NOVEL.—BY MISS M. E. BRADDON,
Author of "Lady Audley's Secret," "The Outcasts," "The Doctor's Wife," "Three Times Dead," etc.
—IN—
THE GOLDEN ERA.
NOW IS THE TIME TO SUBSCRIBE!

Opinions of the Press:

THE GOLDEN ERA.—We would call the attention of all newly-arrived Californians to this excellent weekly cotemporary. We have seen the Era so frequently at the family fireside, and in the rude cabins of many industrious miners; that it would seem superfluous to recommend it to old Californians. It is the oldest literary journal on the coast. [S. F. Mining and Scientific Press.

THE GOLDEN ERA, which has just entered upon its fourteenth volume, is fully entitled to be considered as THE literary paper of the Pacific coast. Its proprietors understand the wants of the community, and furnish their readers with all the popular works of fiction as fast as the proof-sheets are received from the Eastern States and Europe, and with a greater variety of original matter in the line of light literature, than can be found in any similar paper on the continent.—[S. F. Alta California.

THE GOLDEN ERA has entered upon its fourteenth year of publication. How many competitors for public favor have been started during this time, and not possessing the freshness and originality of the GOLDEN ERA, have struggled through a short, sickly existence—at last to "flicker out"—almost unnoticed. No single paper in the State is more read and admired, and friends in the States appreciate it fully as highly as the thousands here who weekly scan its columns. It is no copyist, being in all its main features Californian, and unlike the "story papers" in general, its contents are interesting to all who take an interest in the literature of this coast.—[Napa Reporter.

THE GOLDEN ERA, as a good family paper, as a literary production, cannot be surpassed within the limits of America, and America beats the world in publication of first-rate literary papers. It is filled to overflowing with excellent reading matter, original and selected prose and poetry. It is now publishing, from advance sheets furnished from New York, two very interesting stories, each chapter of which is alone worth the subscription price of the GOLDEN ERA.—[Folsom Telegraph.

THE GOLDEN ERA is decidedly the best journal of the kind on this coast, and, we had almost said, in the United States. It is prepared with great care and labor, and publishes an immense amount of reading matter. The serial stories of the best authors are printed in its columns, and its local gossip is always pungent, racy and instructive.—[S. F. Examiner.

THE GOLDEN ERA is one of the best journals of its class in the whole country, and is carefully and intelligently conducted.—[S. F. American Flag.

THE GOLDEN ERA is enlarged by the addition of eight columns of reading matter. It was never more worthy the support of the reading public than at present.—[S. F. Morning Call.

THE GOLDEN ERA is decidedly the best family paper published in the State and we are pleased to learn that it is in a flourishing condition.—[Sacramento Bee.

THE GOLDEN ERA, as a strictly literary and news paper, is chief among the best. Its correspondence and editorials are of that originality of style so peculiar to this coast.—[Oregon Sentinel.

THE GOLDEN ERA is the best literary paper published on this coast. It abounds in stories both real and fictitious, which are worth a careful perusal by every one.—[Santa Cruz Sentinel.

THE GOLDEN ERA is as good a literary paper as can be procured on the continent.—[Red Bluff Independent.

THE GOLDEN ERA has entered upon its fourteenth volume. It is by far the best literary and family paper ever published on this coast.—[Sonoma Democrat.

THE GOLDEN ERA is a most ably conducted literary journal, in every way worthy of its large circulation, and characterized by a flow of wit and freshness of satire in dealing with the prominent follies of the age that is truly refreshing.—[Deseret News, Salt Lake City.

THE GOLDEN ERA is a fine family and literary paper, as the broad Union anywhere can boast of.—[Denver Rocky Mountain News.

THE GOLDEN ERA is the best family journal in the United States.—[Salt Lake City Telegraph.

THE GOLDEN ERA is a highly handsome quarto of fifty-six columns, comprising the freshest and the richest cream of American belles lettres. Nothing north or south, or east or west, can be compared to it as an elegant family and literary newspaper.—[Union Vedette, Salt Lake City.

THE GOLDEN ERA, instead of economizing during these dull times and presenting a paper to match the times, is as brilliant as ever. It has a talented corps of litterateurs, and keeps fully up to the mark.—[S. F. Dramatic Chron.

THE GOLDEN ERA is now in its fourteenth year of publication, and is established on a firm basis. It has a larger number of regular contributors, and gives a greater variety of reading matter than any other paper of the kind published in San Francisco.—[Quincy Union.

THE GOLDEN ERA has commenced its fourteenth year with a steady improvement in literary and typographical appearance.—[Yreka Journal.

THE GOLDEN ERA began in the infancy of the State, and has grown with it, until there is now hardly a post office in the State, or on this coast, where it is not taken. It employs the best writers in the Atlantic States, in Europe, and in California.—[Colusa Sun.

New Mining Advertisements.

Continued Mining Advertisements will be found under another head

Cosala Silver Mining Company, District of Cosala, Sinaloa, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of the Cosala Silver Mining company, held on Saturday, the 24th day of March, 1866, at the office of the company, an assessment of one dollar ($1) per share was levied on each and every assessable share of the capital stock of said company, payable immediately in gold coin of the United States of America, to the Secretary, at the office of the company, No. 510 Battery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Thursday, the 26th day of April, 1866, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 12th day of May, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

CHAS. BAUM, Secretary.
No. 510 Battery street, opposite the Custom House, San Francisco. mar31

Comet Petroleum Company, Mattole District, Humboldt County, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the twenty-second (22d) day of January, 1866, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Trustees, made on the 22d day of January, 1866, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., on the 14th day of April, 1866, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. L. CROSBY, Secretary.

Office, 36 Exchange Building, northwest corner Montgomery and Washington streets, San Francisco. mar31

Postage.—The postage on the MINING AND SCIENTIFIC PRESS to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and county. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents.

SUBSCRIBE FOR IT.—The large, illustrated sixty-four column weekly newspaper—the San Francisco MINING AND SCIENTIFIC PRESS—should be taken by every miner, prospector, and intelligent citizen throughout Colorado, as it gives a mint of most useful information to be gained no other way, on mining matters generally.—[Rocky Mountain News.

Julia Gold and Silver Mining Company, Virginia, Storey County, Nevada.

P. R. RINGSTROM, Secretary.

Office, 210 Pine street, up stairs, San Francisco. m31

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three month's delay requisite in transacting business through Eastern agencies.

ELECTROTYPE CUTS, ENGRAVINGS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State.

Mining Notices--Continued.

New Mining Advertisements to be found under another heading.

Beard & Seaver Gold and Silver Mining Company, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 14th day of March, 1866, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately, to the Secretary, 402 Front street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 14th day of April, 1866, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Tuesday, the 1st day of May, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

N. C. FASSETT, Secretary.

Office, 402 Front street, San Francisco. mar17

Blue Ledge Gold and Silver Quartz Mining Company, Kelsey District, El Dorado County, California

Office, No. 10 Government House, corner of Sansome and Washington streets, San Francisco.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 14th day of March, 1866, an assessment of one dollar ($1.50) and fifty cents per share on each and every share of the capital stock of the Blue Ledge Gold and Silver Quartz Mining Company, was levied, payable immediately, in United States gold coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Saturday, the 14th day of April, 1866, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 28th day of April, 1866, at 12 o'clock M. of that day, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

mar17 J. M. BUFFINGTON, Secretary.

Eagle Quartz Mining Company, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 5th day of March, 1866, an assessment of one dollar ($1) per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the Office of the Company, No. 10 Exchange Building, in San Francisco.

Any stock upon which said assessment shall remain unpaid on the 7th day of April, 1866, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 23d day of April, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

JOHN M. BURNETT, Secretary.

Office, No. 10 Exchange Building, San Francisco, California. mar10

And in accordance with law, and an order of the Board of Trustees, made on the 7th day of February, 1866, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Olney & Co., at No. 626 Montgomery street, San Francisco, Cal., on Saturday, the 31st day of March, 1866, at the hour of 12 o'clock, M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. M. BUFFINGTON, Secretary.

Office, No. 10 Government House. mr17

BOOKS IN THE OLDEN TIME.—Before the art of printing, books were so scarce that ambassadors were sent from France to Rome to beg one copy of Cicero's works, and another of Quintillan's, because a complete copy of these books were not to be found in all France. Albert Abbott, of Glembours, with incredible labor and expense, collected a library of one hundred and fifty volumes; and this was considered a wonder indeed. In 1494, the library of the Bishop of Winchester contained parts of seventeen books on various subjects; and on his borrowing a book from the Convent of St. Swithin, he had to give a heavy bond, drawn with great solemnity, that he would return it uninjured. When a book was purchased, it was an affair of such consequence that persons of distinction were called together as witnesses. Previous to the year 1300, the library of the University of Oxford consisted only of a few tracts, which were carefully locked up in a small chest, or else chained, lest they should escape; and at the commencement of the fourteenth century the royal library of France contained only four classics, with a few devotional works.

AN ENCOUNTER WITH A BEAR.—A man living near Pembina, (in Dacotah Territory) had a terrible fight, not long since, with a grizzly bear, for his boy—a fine lad, ten years of age. The father and son were out in the brush, looking for a colt that had strayed off, and more than a rod apart, when suddenly a bear rushed upon the boy with terrible ferocity. The child had time to give out one wild, heart-freezing shriek of horror before the bear seized him. The father, drawing a large hunting-knife from its sheath, leaped to the rescue, and a horrible contest ensued. The bear was a powerful creature, and ferocious with hunger; but the father was fighting for his boy. Though much torn by the teeth and claws of the bear, he won the fight and succeeded in carrying his son home in his arms, where both were at last accounts, rapidly recovering from their wounds.

A LITTLE boy, five years old, was carried off by eagles while playing in the woods near Maynesville, Mo., not long since. His body was found shortly after, with nearly all the flesh picked from the bones.

J. B. CONE, BUSINESS AGENCY.—Makes private sales of Property and Business Places of every description, in the city and throughout the State; procures partners with large and small amounts of money; negotiates sales o mining property, and does a General Agency Business. GEORGE E. BROWN,

(Late Assistant Examiner in the U. S. Patent Office,)

HAVING RESIGNED THAT POSITION AFTER A TENure of office of eighteen months, offers his services to

INVENTORS AND THEIR ASSIGNEES,

—AS A—

Patent Solicitor,

He will make Preliminary Examinations in the Patent Office, with a view to ascertain the Patentability of any invention that may be submitted to him for that purpose; will prepare the necessary papers for those who wish to make Applications for

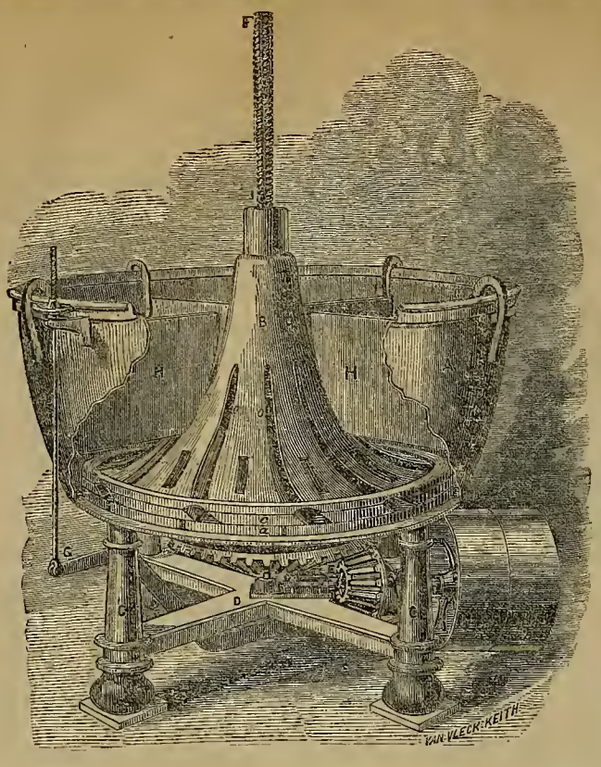
Patents for their Inventions,

—OR FOR—

EXTENSIONS OR REISSUES OF PATENTS

Already granted; will act as an Attorney in presenting Applications at the Patent Office, and in managing them to a final issue; will draw up Assignments; will examine into the condition of Rejected Applications when desired to do so, and undertake the prosecution of such as may be considered patentable, and do whatever else is usually done by Patent Solicitors.

Address, P. O. Box 257, Washington, D.C. 7v12-3m



THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and *o*, Openings,

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

THE PRESS is a large, sixteen-page paper, and is truly a valuable assistant to the mining interests of the Pacific Coast.—[Nye County News.

He Foroot Something!—'What did your mother say, my little man? Did you give her my card?' asked an inexperienced young gentleman of a little boy whose mother had given him an invitation to call upon her, and her street door was accordiagly opened to his untimely summons by the urchin aforesaid.

'Yes, I gave it to her,' was tho reply, 'and sho said if you wasn't a nat'ral born fool you wouldn't come Monday aioraiug, when everybody was washing.'

At this juncture mamma, with a sweet smile of welcome, made her appearance at the entrance of the hall, when to her surpriso, Mr. Verysopht, the visitor, had bolted.

'What does the man mean?' inquired mamma.

'Dunno,' replied Bub; 'guess he's forgot sumthiu'.'

Removal.

The Office of the Mining and Scientific Press has been removed to the old printing stand known as Waters Bros. & Co., southwest corner of Clay and Sansome streets, opposite the Niantic Hotel (being one block south of our forme location), where we may now be found, with more commodious apartments and an extensive Job Printing Office.

San Francisco, April 10th, 1865.

To Printers.

We have for sale, at a bargain, a Second-hand Half-Medium (largest size), Ruggles' Engine Job-Printing Press, of most approved pattern. It is in excellent condition, and warranted to work as good as new. Apply soon, at the office of the Mining and Scientific Press. 19v11tf

5v12tf 72 William street, New York.

QUARTZ OPERATOR'S HAND BOOK

A Book for Every Intelligent Prospector, Shareholder, Miner and Machinist.

ZENAS WHEELER AND P. M. RANDALL,

Authors and Publishers.

Bound in Cloth—144 Pages, Duodecimo.

The Quartz Operator's Hand Book is presented to the public as a carefully prepared epitome of all that is valuable for the practical operator in the mine and mill. We have here all the most necessary hints and directions for testing and assaying the ores of the various minerals; an explanation of chemical terms; a brief and intelligible description of the numerous processes for roasting ores, and the extraction of metals from their ores by amalgamation and otherwise.

The work also contains an original and highly interesting discussion of the tractory and differently formed grinding plates, as applied to the reduction of ores—a subject not only of special interest to the scientific reader, but also practically of the highest importance to every quartz miner

Professor Silliman, of Yale, and Hodgson, of the College of California, having examined this discussion, as submitted to them by its author, Mr. Randall, previous to the compilation of this work, speak of the same as not only mathematically correct, but also as of great practical value. Messrs W. R. Eckart, Jr., Engineer, (late of U. S. N.,) and W. M. Belshaw, assayer and superintendent of the S. T. M. Co., to whom the entire work was submitted while passing through the press, speak of the same as one of high practical importance to quartz miners and millmen generally.

No work has been offered to the mining public of California which contains so much valuable information, condensed into so convenient a space as is here presented. In its preparation, much care has been taken to secure brevity, conciseness, and simplicity—in fact to make it a complete and reliable Quartz Miner's Hand Book.

The Table of Contents of this book will be found on pa 415 of the Mining and Scientific Press of July 1st, 1865.

Sold by booksellers generally. Price by mail, postage paid, $1.25. Address "Wheeler & Randall, at the Mining and Scientific Press Office, San Francisco." 2v11

Book Printing should be considered and treated as one of the higher branches of the "Art of Arts," and its execution entrusted only to experienced and intelligent workmen. Strict attention will be given to all orders for Book and Pamphlet Printing entrusted to the Mining and Scientific Press Job Office.

Machinery.

HUNTER'S PREMIUM CONCENTRATOR, AMALGAMATOR AND SEPARATOR,

Awarded a Silver Medal at the late Mechanics' Fair.

Hunter's Concentrator can be seen in operation daily at the Novelty Iron Works, Fremont street. Parties wishing to purchase Concentrators will find it to their advantage to examine the above machine before purchasing elsewhere, for the following reasons:

1st. It will work the sands from a 5-stamp battery, and save from 10 to 20 per cent. more sulphurets than any machine built on the Pacific coast.

2d. The Sulphurets are washed clean, containing less than ten per cent. of sand.

3d. The waste free gold and amalgam is amalgamated on the copper plates; no trace of ground mercury and scarcely a trace of metal passes off with the sand.

4th. Its simplicity is a sufficient recommendation for its general use as a Concentrator. The variation of speed in a Quartz Mill does not effect the working of the Machine. The same was demonstrated at the late Mechanics' Fair, when with the greatest irregularity of speed the best of results were given.

5th. There is no clogging or stopping to clean out the sulphurets and sand; consequently no waste from any inattention on the part of the attendant.

6th. In exhibiting the working of the machine (it is not run empty), all classes of ores and tailings, from 50 pounds and upwards, are concentrated that parties may see it to test the machine with.

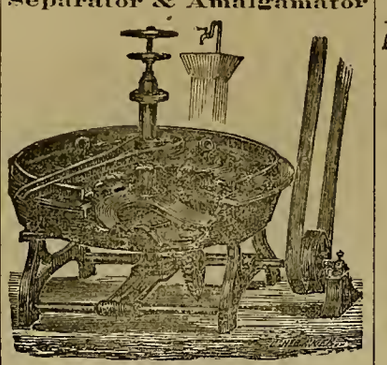
Give it a trial, and satisfaction is guaranteed. All orders and any information required, address,

ANDREW HUNTER,

Novelty Iron Works, Fremont st., San Francisco.

15v11-3m Or to E. T. STEEN, Agent.

BAUX & GUIOD S Separator & Amalgamator



Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine Scientific Knowledge with Practical Experience, these Pans extract more gold and silver from their ores than any others in use, and a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in paris convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crall's Gravel Cement Works, Nevada county; Waltman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Heugh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6df

BLAKE'S QUARTZ BREAKER

Is now extensively used for breaking hard masses of

Quartz or Ores

To a size suitable for stamps. These machines are patented, and are in practical operation in

CALIFORNIA, AUSTRALIA,
WASHOE,
ENGLAND, FRANCE,
—AND—
THE ATLANTIC STATES.

These Machines, or circulars containing further information regarding them, may be obtained of the undersigned.

Address,

BLAKE & TYLER,

Box 2077 San Francisco Post Office.

CHAS. T. BLAKE, Idaho City. E. TYLER, Michigan Bluff. WM. P. BLAKE, San Francisco.

4v10

Hepburn & Peterson's AMALGAMATOR.

The Subscribers would call the attention of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phoenix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, Bryant St. bet. 3d and 4th. [Illustrated in the Mining and Scientific Press, April 9th, 864.]

LEFFEL'S American Double Turbine WATER WHEEL.

This Wheel, which has had the most unprecedented sale of any water-wheel ever made, and which has given unusual satisfaction whenever used, is now for sale by KNAPP & GRANT, 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These Wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 500 feet fall Let us know how much water you have either in miner's inches or cubic feet per minute, what fall you have, and what power you require Write or send for circular to

KNAPP & GRANT,

—ALSO— San Francisco.

Leffel's Lever Jacks,

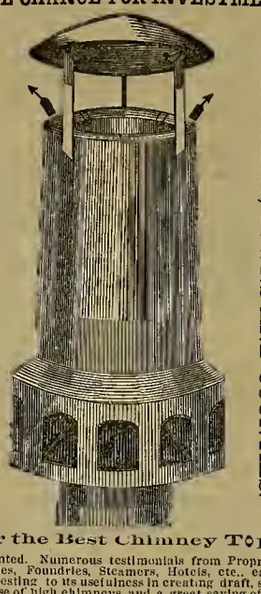
For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Truck Jacks of the most superior make and kind.

For sale by **KNAPP & GRANT,**

12v12-3m San Francisco,

A RARE CHANCE FOR INVESTMENT.

THE PATENT RIGHT FOR SALE



FOR STATES, TOWNS AND COUNTIES.

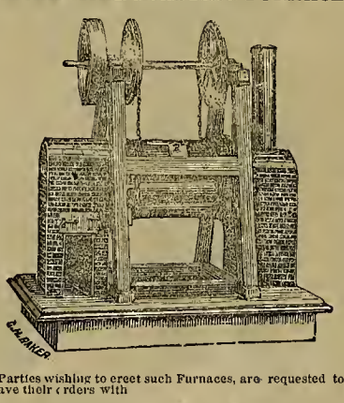
For the Best Chimney Top

Ever Invented. Numerous testimonials from Proprietors of Factories, Foundries, Steamers, Hotels, etc., can be shown, attesting to its usefulness in creating draft, saving the expense of high chimneys, and a great saving of fuel.

Pamphlets containing descriptive drawings and testimonials will be sent free, upon application by letter or otherwise to the patentee. **B. A. HENRIKSEN,**

12v12-3m No. 328 Kearny street, San Francisco.

The Mechanics' Institute AWARDED A PREMIUM SILVER MEDAL TO BRUCKNER'S MECHANICAL ROASTING FURNACE.



Parties wishing to erect such Furnaces, are requested to leave their orders with

T. KALLENBERG,

12v11 416 Market street, San Francisco.

Economy in Advertising.—The Mining and Scientific Press is the best and most economical mining advertising medium in this city. Our terms are less than one half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

Volume Twelfth.—The Mining and Scientific Press, with its last issue, commenced its twelfth volume. Since Dewey & Co. have "held the ribbons" its gait has been rapid toward a perfect journal. Its appearance evidences its prosperity, but doubtless, like some of the rest of us, it can stand increased encouragement. Let such be given, and, our word for it, volume thirteen will acknowledge receipt.—[Golden Era.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the **PACIFIC FOUNDRY,**

1v1 San Francisco.

Prater's Patent Concentrator

(Known as HUNGERFORD & PRATER'S Concentrator,)

MANUFACTURED AT THE

San Francisco Foundry and Steam Engine Works.

Corner Fremont and Mission Streets.

All orders promptly attended to.

2v12 **DEVOE, DINSMORE & CO.**

Important to Miners.

NEW PATENT ROASTING PROCESS.

I am now prepared to offer to the mining community a New Roasting Process, which has been approved as novel and beneficial by the best authorities in Europe. A Furnace can be erected in a few days at a trifling expense, and one man is able to Roast ten tons of Ore or Concentrated Sulphurets per day,

MORE COMPLETELY AND CHEAPER

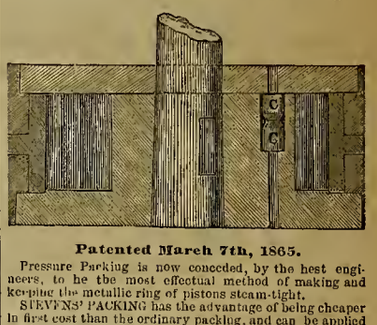
Than any other Process. All the Sulphur is saved, by being converted into Bisulphide of Carbon, which is a valuable product, and will pay nearly all expenses.

For particulars, apply to

J. MOSHEIMER,

26v11-3m 423 Washington street.

Stevens' Pressure Packing.



Patented March 7th, 1865.

Pressure Packing is now conceded, by the best engineers, to be the most effectual method of making and keeping the metallic ring of pistons steam-tight.

STEVENS' PACKING has the advantage of being cheaper in first cost than the ordinary packing, and can be applied to old style pistons with very little alteration or detention. In place of testimonials, the Patentee requests of those who are using the old spring packing to inquire of the owners of the various engines which now have this packing in use—some of which have been running from three to twelve months without being opened, or showing any descriptive leak—and act upon their recommendation.

Further particulars can be had by applying to the Patentee, ANDREW STEVENS, Master Mechanic, Alameda Railroad, or at the VULCAN IRON WORKS, where they can be seen, at any time, in course of construction.

10df **ANDREW STEVENS.**

Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make.

COMBINING THE MAXIMUM OF EFFICIENCY, Durability, and Economy, with the Minimum of weight and Price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.

Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of milling enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Grist Mills.

For sale by **TREADWELL & CO.,**

3v12-3m Corner of Front and Market streets.

PETROLEUM STOVES.

A **MOST USEFUL INVENTION FOR ALL** manner of COOKING and for IRONING, without any litter, as ashes or soot. Cheap and convenient, and peculiarly suited to the wants of this community.

Cooking by them is divested of its disagreeableness, and becomes a pastime, as many can testify, who have used them in this city. To be seen at

316 Montgomery street,

Where they are for sale by

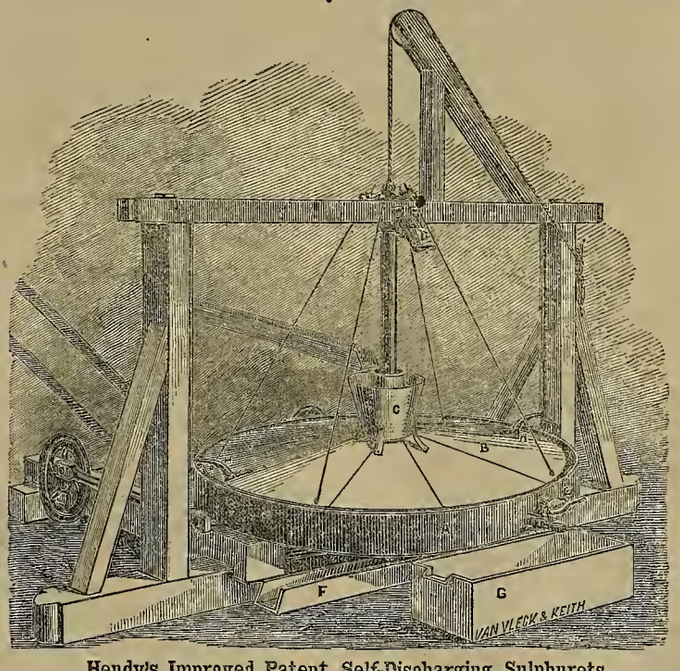
NOTICE TO QUARTZ MINERS.



Hendy's Improved Patent Self-Discharging Sulphurets
PRATER CONCENTRATOR
Is Receiving Universal Favor.

Reference is made to the following Mills which are using the Prater Concentrator, with some of the improvements attached. The Self-Discharging Sulphurets has been more recently adapted, and the public attention is called to examine its workings:
STEPHENS' MILL, Humboldt County, Nevada.
CHRYSOPOLIS MILL, " "
U. S. REESE RIVER MILL, Austin, " "
CARROL & ASPINWALL MILL, Reese River, Nevada.
UNION MILL, El Dorado County, near Mud Springs.
NEW YORK AND EL DORADO CO., " "
BLUE LEDGE MILL, near Spanish Flat, El Dorado Co.
CONEY MILL, Jackson, Amador County.
Messrs. TUBBS & CO'S MILL, San Andreas, Amador Co.
WINTER'S MILL, Angels Camp, Calaveras County.
CLIO MILL, Jacksonville, Tuolumne County.

And in use in other parts of this State; also in Idaho, Arizona, Colorado and Mexico.
As a further evidence of its worth, orders have been received recently from the proprietors of the following mills, all of whom are using these Concentrators, or have works in the immediate neighborhood of mills using them, viz.:
One Concentrator ordered for the Coney Mill, Jackson, Amador County, by Messrs. Bigelow & Bro., of this city.
Three Concentrators for the Spring Hill Mill, Volcano, Amador County.
Two Concentrators for the Golden Gate Mill, Volcano, Amador County.
Four Concentrators for the Raw Hide Ranch Mill, Sonora, Tuolumne County.
They may be seen in operation at the GOLDEN STATE FOUNDRY, No. 13 First Street, San Francisco.
☞ For explanation of the above engraving, and other particulars, send for a Circular.

THE CIRCULATION of the PRESS, already extensive, is rapidly increasing, and substantial men who can profit by widely disseminating information of their business amongst the most intelligent, influential and industrial classes of the Pacific States and Territories will find no more effectual or economical medium for advertising.

DEWEY & CO., Proprietors.

Patent Agency and Job Printing Office, 505 Clay street, San Francisco. April 1, 1866.

Judicious Resolutions.

Several of our most substantial and judiciously managed mining corporations have passed resolutions, since the approval of the new assessment law, requiring all notice of assessments and sales to be published in the MINING AND SCIENTIFIC PRESS, the only thorough (daily or weekly) mining journal on this coast. Our efforts to concentrate all mining advertisements in one paper, for the economical convenience of shareholders and assessment payers, are meeting with decided success. Those who believe in supporting the mining cause, should bear our paper in mind, and bring up this subject at the next trustees or shareholders' meeting.

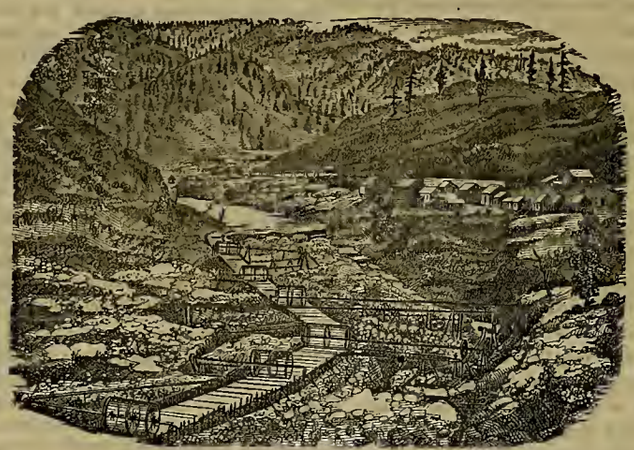
PIG IRON.—From the *Iron Age*, of March 8th, we learn that the total production of pig iron in the United States, according to statements made at the quarterly meeting of the American Iron and Steel Association, held at Washington, D. C., Feb. 27th, 1866, was in 1865, 910,555 tons; while in 1864, it was 1,130,280 tons; thus showing a decrease in one year of 219,725 tons. There was also, at the same time, a large decrease in the production of steel.

NEW TYPE.—The *Daily Alta*, of this city, has come out in new type, which makes a handsome print.

CALIFORNIA RIVER MINING.

The annexed engraving represents one of a peculiar class of mining scenes, often met with in the Summer season, in the mountains of California. This kind of mining is called a "fluming operation," and is conducted in the following manner:

During the season of low water in the rivers, which usually lasts from July to November, the miners, in order to work the bed of a stream, build a dam at some convenient point; and from that dam construct of boards, a flume capable of carrying all the water then in the river, over so much of the river bed as they propose to work during the Summer. The dam being made tight, and the water let into the flume, the bed of the stream is laid bare for the convenient operations of the miner. These flumes are constructed of common unplaned inch boards, properly secured by frame



work and sustained by supports. They vary in size according to the amount of water which they are expected to carry. At intervals along this flume, are generally placed what are called "stream wheels"—that is, water-wheels made like steamboat wheels. When the paddles or floats of these wheels are dropped down into the current of water passing through the flume, they are made to revolve by the action of the current, and so revolving are capable of driving the pumps required to remove the seepage water from the excavations which the miner makes in obtaining his auriferous sands from the river bed.

By examining the picture, the reader will observe that the wheels are constructed with long axles, extending from the wheel in the flume quite to the opposite side of the now dry bed of the stream. Attached to these axles, and generally near their outer extremity, small pulleys will be observed, over which are made to pass the belts of chain pumps, a peculiar class of pumps generally used in freeing placer mines from water, and constructed of a succession of buckets attached to a belt of India rubber or canvas. Pumps worked by valves could not be used for such a purpose, because they would soon be choked up by the gravel, and rendered useless; while the chain pump readily brings up the gravel that may be mixed with the water.

The course of the stream, represented in our engraving, may be easily traced winding around among the hills. The white spot near the centre of the picture is the pond formed by the dam, from which the water may be seen running through the flume, quite to the foreground and driving, in its course, no less than six different wheels.

By the aid of the pumps driven by these wheels, the miners are able to sink holes down through the gravel and boulders quite to the bed-rock of the river, near and upon which the chief part of the gold is usually found. The river beds in this way are worked over and over again, year after year. Of late years, however, the most of this kind of work is done by Chinamen, who are satisfied to labor for very small pay. Such "diggings" will not, in many places, pay enough to induce Americans to engage in them.

The gravel in the beds of the rivers, is often found 15, 20 and 30 feet in depth. It is deeper toward the mouths of the rivers, where the stream is less swift, than nearer their source, where the water runs so rapid as to wash nearly everything away.

We often read about the "bars" on the streams, where large amounts of gold are taken out from the gravel. These bars are quite different from the bars which we read of as obstructing the mouths of rivers, often rendering it very difficult for vessels to enter. These last mentioned bars usually extend quite across the stream, and are generally covered with water. They are properly so called, because they extend across from bank to bank, as bars in a fence extend from post to post. In both cases these bars are deposits of sand formed by opposing currents, eddies, etc.; but those deposits which the miner usually calls a bar, is an accumulation of sand on the bank of a river, which is submerged at high water; but which is always bare at low water, so that at such times they can be worked without fluming. The term 'bar' in this case is misapplied; but long and general usage compels us to accept it.

These latter bars on the mountain streams of California, have usually been found immense sources of wealth. From some of them, millions of dollars' worth of gold have been worked out. When such a bar is found, great numbers of miners usually flock thither, and sometimes quite a town is built up close by.

The locality represented in the engraving appears to have been such a place; and after the bar was worked out, the river was flumed to get the gold from the bed of the stream, which is almost always rich directly opposite or just below a bar. You will see that quite a little town has grown up, on the high ground just above the bar. Such settlements were formerly very common all along the larger streams throughout the mountains.

PATENT ROPE HOSE COVERING.—In our advertising columns will be seen an illustration of this useful invention. We understand that orders from the interior for this article are increasing, and that where used, its character for utility is well sustained.

New California Patents.

Mr. John Mott's application for letters patent for a revolving plow, through the agency of the MINING AND SCIENTIFIC PRESS, has been allowed. Two applications for improvements on this valuable invention by the patentee are now pending through our agency.

Mr. John Evans, of Virginia City, has received notice that his application for letters patent for improvement in safety cages for hoisting in mines, has been allowed through the agency of this office. The following patents have also recently been issued:

QUARTZ CRUSHER.—John Fleck, Santa Cruz, California: First I claim the two jaws, A A, provided with two upper inclined parts, a a, and lower vertical parts, b b, in connection with oscillating frame or walking beam, B, and frames, F F, all arranged to operate in the manner substantially as and for the purpose set forth.

Second, I further claim the combination of the jaws, A A, oscillating frame, B, and the wheels, f f, for securing the upper ends of the jaws in the frame as herein specified.

This invention relates to a new and improved machine for crushing quartz, and it consists in the employment or use of two jaws arranged to operate with a reciprocating motion.

GOLD AND SILVER WASHING APPARATUS. Joshua Hendy, San Francisco, California: I claim, First, the guide fingers, T T, attached to distributor, G, working in slides, V V, or their equivalent.

Second, The riffle bars, R R, coated with mercury, for the purpose as herein set forth.

Third, I claim the riffle bars, R R, guide fingers, T T, and slides, U U, in combination with distributor, G, and pan, B, with convex bottom, and central outlets, e e, substantially as described and for the uses and purposes as hereinbefore set forth.

MECHANICS' INSTITUTE.—We understand that the work of grading the lot for the new building on Post street, has already been commenced. Notice of an important meeting has been issued as follows:

To the Stockholders of the Mechanics' Institute of the city of San Francisco:—There will be a special meeting of the stockholders of the Mechanics' Institute of the city of San Francisco, at the Rooms of the Institute, 529 California street, city and county of San Francisco, on Friday evening, April 20, 1866, at 7½ o'clock. The object of this meeting is to consider the propriety of authorizing and empowering the President and Board of Directors of said Mechanics' Institute of the city of San Francisco, to sell the lot and building now owned and occupied by the Institute, on California street, and to make a good and sufficient deed of the same, and to transact such other business as may come properly before the meeting. H. J. BOOTH, President.

J. B. PIERCE, Recording Secretary.

OUR PAPER IN NEW YORK.—Our agent, Mr. George M. Newton, 72 William street, New York, is forwarding a goodly number of Gotham subscribers to the MINING AND SCIENTIFIC PRESS by every steamer. Many of the names are highly appreciated on our list beyond the matter of pecuniary support.

TRIUNFO.—We understand that Eastern capital has been secured to this company. A large order has been already given to the Pacific Iron Works in this city for additional stamps and other machinery for the mill of the company, located in Lower California. We are without further particulars.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

THE TRACTORY CURVE, AND THE PROPERTIES OF GRINDING PLATES.

BY W. A. GOODYEAR.

[CONTINUED FROM PAGE 194.]

Let us now compare the different results we have obtained.

In doing so, I shall assume that in all cases the exterior radius of the plates is a, and their inner radius $\frac{a}{3}$ (which are the dimensions given on page 112 of the Hand Book, for the combination called "Randall's Patent Grinding Plates,") and that the vertical pressure at the outer circumference of the plates while in motion is P. I have already found the grinding effect of Randall's Plates under this supposition in a single revolution, which is

$$(77) \qquad \frac{13}{9}\,\pi^2\,P\,a^2.$$

For circular plates of uniform hardness, we have

$$(78)\int_{\frac{a}{3}}^{a} 4\,\pi^2\,P\,ay\,dy = \frac{16}{9}\,\pi^2\,P\,a^3.$$

For plane circular plates whose hardness varies as y,

$$(79)\int_{\frac{a}{3}}^{a} 4\,\pi^2\,P\,y^2\,dy = \frac{104}{81}\,\pi^2\,P\,a^3.$$

For conical plates of uniform hardness.

$$(80)\int_{\frac{a}{3}}^{a} 4\,\pi^2\,P\,ay\,dy = \frac{16}{9}\,\pi^2\,P\,a^3.$$

For tractory conoidal plates of uniform hardness.

$$(81)\int_{\frac{a}{3}}^{a} 4\,\pi^2\,P\,ay\,dy = \frac{16}{9}\,\pi^2\,P\,a^3.$$

Expressing the fractions in the above results as decimals, we have—

From (77).....1,444 π^2 P a^3.
From (78).....1,778 π^2 P a^3.
From (79).....1,284 π^2 P a^3.
From (80).....1,778 π^2 P a^3.
From (81).....1,778 π^2 P a^3.

Hence, we see that with plates of the same size, and having the same vertical pressure at their outer circumference while in motion, the plane circular plates, the conical plates, and the tractory conoidal plates, if they are all of uniform and equal hardness, give the same grinding effect in a single revolution. "Randall's Plates" give less than these, and plane circular plates, whose hardness varies as the radius give the least of all for the same amount of motion.

But it is important to observe that in order that the plates of uniform hardness should have the same pressure *at the circumference* as plates whose hardness varies as the radius, it is necessary that in the former case the plates themselves should be heavier than in the latter, since in the first case the pressure *increases* from the circumferenee towards the center, while in the latter it is constant.

With the increased weight of the plates under these conditions, is connected of necessity an increase in the *power* required to drive them at an equal speed; and, moreover, this *increase* in the power required, corresponds precisely in amount with the increase in the grinding effect produced.

It is evident, from what precedes, that although tractory conoidal plates do, in fact, possess the property of constant wear parallel with the axis of revolution, this property is *not* the result of their peculiar form, and they possess it *in common* with all the forms above considered.

I will make hut a single reference more to the "Quartz Operator's Hand Book."

The *analytical* discussion which it contains of the tractory curve alone is, I believe, correct as far as it goes, except for the numerous misprints, which are not, however, the fault of the author.

The grinding effect of tractory conoidal plates, and also of plane circular plates, whose hardness varies as the radius, is correctly given on page 107. The effect of plane circular plates of uniform hardness is incorrectly obtained on page 108, owing to an error in the assumption connected with what is there called the "tendency to wear." The result for conical plates on page 110 is incorrect for a similar reason. The result for circular plates of varying hardness on page 111 is incorrect, hy reason of a palpahle mistake in substituting the value of y iu the integral which gives it. The result for circular plates of uniform hardness, given on page 112, is necessarily incorrect, the integral from which it is obtained being incorrect. The result for conical plates upon the same page is incorrect for a similar reason. The latter part of the diseussion of Randall's Plates on page 113, I confess my total inability to understand. The result, however, is wrong.

In the preceding discussion I have supposed the plates to simply grind *each other;* but the same reasoning and the same results hold good if we suppose a layer of other material interposed between them, provided only that this layer be of *uniform thickness.*

The results which I have ohtained show that, in a theoretical point of view, not only do the tractory conoidal plates *possess no advantages* over plane circular ones, so far as their grinding effect is eoncerned, but also, that if we take into account the *power* required to drive the plates (which we must do in order to obtain a just eomparison), *none* of the forms considered possess any advantages ahove any of the others in their theoretical grinding effect.

I have thus far discussed the subject from a *purely* theoretical point of view, supposing the conditions of hardness, distribution of pressure, etc., to he *perfect.* If, now, as is undoubtedly the case, it is found in practice that grinding plates often wear *unequally,* this circumstance is due either to inequalities in the hardness of the opposing surfaces, which, to a eertain extent, are unavoidable, or to circumstances connected with the feed and discharge, and the varied arrangements in other respects of different pans, which may interfere with the uniform distrihution of ore hetween the plates, or otherwise change the conditions of the prohlem.

W. A. GOODYEAR,
Civ. and Min. Eng.

San Francisco, January 26, 1866.

[Conclusion.]

WELL GUARDED.—The vaults of the Bank of France, which contains more treasure than any other single spot on the face of the globe, are accessible through an iron door, which has three keys, and these keys are kept by three leading officers. The iron staircase which leads to the vault can he detached, and, hy a chemical apparatus, a supply of deadly gas can be made to penetrate every part, destroying human life in a few seconds, while the whole vault can be submerged in ten minutes.

'WHAT are you doing?' said a father to his son, who was tinkering an old watch. 'Improving my time,' was the rejoiader.

THE longest railroad in the world is the Grank Trunk of Canada—from Detroit to Portland—837 miles.

[Written for the Mining and Scientific Press.]

From Calaveras County.

[BY OUR SPECIAL CORRESPONDENT.]

In a letter from Mokelumne Hill, written several weeks since, I promised to give some account of the prospects of quartz miaing in that section, hut circumstances having prevented my doing so during my stay at that place, I take advantage of a rainy day, though in a distant part of the county, to give you a synopsis of a few hriet notes on the subject taken while at that place. The principal claim in the immediate vicinity of the "Hill" is

THE SPRING OULCH LEAD,

Sitnated one and a half miles southeast of the town. It is in a slate formation, and its general direction is about north and south, dipping eastward at an angle of forty degrees. A shaft has heeu sunk to a depth of sixty feet, by tbe owners, Messrs. Lamphear, Morris and some other residents of Mokelumne Hill, and develops a fine, regular vein lour feet in thickness, tbe quartz Irom which prospects well. An overshot wheel forty feet in diameter, and capable of driving a 10-stamp mill, has been erected, and two large arastras put in operation, for the purpose of tcsting the rock, prepartory to putting in stamps. Ths arastras are each fourteen feet in diameter, and capable of working two tons of quartz daily. No clean up had been made at the time of my visit, but Judge Morris, who was in charge of the mill, estimated by the amount of quicksilver used, that tbe rock would yield tweaty-five dollars per ton.

I am indebted to Mr. R. W. Dowling for information concerning a quartz vein being prospected by a company of citizens, among whom are Messrs. Paul, Smith, Peck, and many others well known in the "Hill." The lead has been opeaed for a distance of seventy feet, hy a tunnel in the hillside. It appears to be about ten feet iu width, and the rock prospects well, though no large quantities have been worked. It is located in a slate formatiou, and lies in a north and south direction, with a dip of thirty-five degrees to the eastward. As it is within a mile of the town, it will, if successful, prove a great benefit to business iu the place. There are several other veins in ths immediats vicinity which have been opened with very good prospects, but on which, from some cause, work is at present suspended. Another mine, the successful development of which will bave a highly advantageous influence upon business at Mokelumne Hill, is

THE FOOTE AND THOMPSON,

Sitaated at Rich Gulch, about five miles distaat. This miae, of which a history was published in the PRESS over a year since, was worked by the former owners to a depth of 200 feet, and yielded over $200,000, but had been abandoned for some years, when it came into the possession of Messrs. Hephura of Drytown, aad Chapman of Copperopolis, who conveyed one-half of the claim to Messrs. O'Neil & Gleason, oa condition that they should complete a tunnel which had been commenced by the former owners, to open the mine 140 feet below the old works. This tunnel was in 120 feet, but had not struck the vein, when it had beeu abandoned. At the end of 250 feet, the ledge was struck where it is about eighteen inches in width, but which widens to three or four leet in a short distance. The tunnel is wholly in the quartz for a distance of 125 feet, wheu it leaves the veiu and runs in the hanging wall, which is of soft slate, laying bare the west side of the vein for a distance of 100 feet. It then cuts through the lead, when it is found to he six feet thick. Forty or fifty feet further in the vein "runs out," and there is no quartz for about twenty feet, after which it comes in about four feet wide, aad continues to improve to the end of the tunnel, where its width is six feet. The length of the tunnel is 820 feet, and the average width of the vein throughout that distance is three and a half feet. The body of the vein is of solid white quartz sprinkled with sulphurets, alternating with talcose schist, aad a reddish "shaly" quartz full of oxide of iron, and said to be very rich in gold. Five tons of the solid quartz, worked in a stamp mill, everything about which was entirely new, paid $7.50 per ton in free gold, no attempt being made to save that in the sulpburets. At the time of the completion of the tunnel, negotiations were commenced for ths erection of a mill, when it was found that Mr. Root of Woodbridge held a trust deed from the former owners, for three-eights of the mine as a security for the payment of claims which he holds against them. This discovery so complicated matters that work oa the mine was stopped, and it has remained in *statu quo* for several months. It is now believed that the owners of the mine will be able to compromise with Mr. Root, and carry on their work during tbe comiag summer, or sell the mine to some one who will.

Since leaviag Mokelumae Hill, I have made a tour through the copper mining region of Amador county, notice of which I shall for the present omit, but of which I hope to give a description in aaother letter in connection with one of the priacipal miaes of this place. For the present I will coafine myself to a notice of the gold miaes encountered siace my last. Of these the most singular are those located on

THE TALC LEDGES

Of Mt. Echo district, Amador county, between Ione City and Sutter. The gold is found in veins of pure talc, of which there are three, which have been traced for a considerable distance, and claimed. They run in a nortb-westerly and southeasterly direction, and are from four to twelve feet wide on the surface, though they have not been opened to a sufficient depth to test their permaaency. The principal claims are the Yosemite of 1,400 feet, and the Mt. Echo of 1,600 feet, owned principally, if not entirely by residents in the immediate neighborhood. The former is managed by Dr. Briak, and the latter by Mr. C. B. Strong of Ione Valley. The best prospected of these is the Yosemite, on which a vertical shaft has beea sunk to a depth of forty feet, and a cross cut run a distaace of twelve feet, without comiag to the walls of the vein. In the center of the shaft is a singular stratum of crystalized carbonate of magaesia, about eight incbes thick, and of great beauty and purity. Dr. B. informs me that he sent 2.500 pounds of his rock to Manning's mill at Sutter, which paid $36.25 per toa. Much of the rock shows free gold, aad some specimens contain it in large quantities. A box of specimens from this vein were sent by express to the office of the PRESS by Dr. Brink, together with a history and description of talc mining in Amador county, which he fears did not reach their destination, as he has not heard from them since. [Specimens noticed last week.]

The Mt. Echo is situated about a mile northwest of the Yosemite. It has been opened to a depth of twenty feet, on a spur west of the main lead. Eight pounds of the rock from this shaft, ground in a coffee mill, paid at the rate of $55 per ton. These ledges show every prospect of heiag rich and permaneat, while their large size, and the soft and yielding character of the rock makes them easy and economical mining. They will doubtless prove a highly profitable investment, should their size aad productiveness continue according to present prospects.

After visiting these claims I proceeded, the same afternoon to Jackson, from whence on the following morning I went, in company with Messrs. Allen and Andrews of Jackson, and my former friend and traveling companion, Mr. Fenton, now located at Jackson, to visit the claim of the Clinton mining company, six miles above. The lode was formerly worked by Mexicans, who have at times struck very rich pockets. The most singular feature of the croppings of the ledge is the large amount of metallic iron they contain; more than I have ever seen in any other veia of this character. The owners are running a tunnel in the hillside under the croppings, which at the time of my visit was in a distance of 138 feet, hut had not yet cut any well defined vein. The placers in the gulch below were quite rich. A few weeks since a piece of gold weighing ten ounces was picked up. We diaed with Judge Robinson, one of the owners of the miae, and returned in the evening in high spirits to Jackson.

After our return, I set out for Mokelumae Hill, accompanied by Mr. Fenton as far as

SPANISH GULCH,

Three and a half miles south of Jackson, near the Mokelumne river. Here Mr. F. is engaged in prospecting a claim with a view to purchasing it should it prove valuable. It now belongs to a Mexican lady by the name of Samiento, who has entered into a contract to sell the mine to Mr. F. should he see fit to make the purchase. It is believed to be a continuation of the same vein on which the mines of Sutter and Amador are located, as the formation of the country, and the direction and dip of the vein are quite similar. The mine has been worked at intervals for four years, and opened to a depth of 120 feet, and about the same distance along the vein. Within that time it is said to have paid its Mexican owners from $20,000 to $40,000 in arastras. Besides the free gold, the rock contains large quantities of rich sulphurets, which by roasting and washing in a horn in the usual way, show a large prospect in fine gold. The old works

having filled with water, Mr. F. has proceeded to sink a new shaft at a distance of something like 200 feet north of the old one, at a point where one had been commenced some years since, and abandoned. They had reached a depth of over forty feet, and while I was there struck the first quartz, which, from its resemblance to that lying about the old works, in all probability comes from the main ledge. Mr. F. is acting in this matter, as the agent of a corporation, formed of prominent New York capitalists, and in which he is himself a large shareholder. He goes at his work in earnest, and is certainly deserving of success. Adjoining this claim on the south is another, owned by residents of Mokelumne Hill, which is being opened with very fair prospects. Mr. Gleason of the latter place was there engaged in running a tunnel on this claim, and as the sun declined in the west, we mounted and together made our way to the "Hill." Best of friends and most genial of companions, good-bye, assured that while memory calls up the names of friends whose companionship I have learned to value, that of Fenton will never be forgotten by

D.

Copperopolis, March 21, 1866.

[Written for the Mining and Scientific Press.]

From El Dorado County.

[BY OUR TRAVELING CORRESPONDENT.]

Messrs. Editors:—After ten days of delightful weather, a cold storm of mingled snow and rain has set in, and as no prospecting can be done to-day, I redeem the promise I made you a few days ago from this place, which (although not so now) has been, and doubtless will be at no distant day, one of the most productive mineral districts of the State.

AT SPANISH DRY DIGGINGS,

Five miles northwest of this place, I had the pleasure of examining the Grit claim, one of the oldest and richest in this part of the county, and also of seeing the identical spot from which the sixteen-pound nugget was taken, which you may have seen at the last State Fair. (I should like to have the money it sold for in New York.) I was informed by Mr. Davis, one of the owners of this claim, that it had yielded large amounts in gold during the last ten years, insuring from $2,000 to $40,000 per annum.

The richest deposits are found in a rotten or decomposed quartz, in much larger masses than any hitherto seen, and also in the crevices of the bed-rock—a species of slate—to which are often seen clinging tiny spangles of gold glittering like little stars in the shadows of the wall. The quartz, except the more solid and richer pieces reserved for the mortar, together with clay and decayed bed-rock, is passed through sluices in the ordinary way.

As sulphurets of iron abound here, some of which I know to contain gold, and as much of the quartz has not undergone sufficient decomposition to set the gold free—much of the clay also being of that sticky, dough-like character, so well calculated to hold the mineral and even to collect it—I should expect soon to find a notice of some prospector claiming the sixteen-pound extension on the tailings. It will pay.

Where this company are now at work there appears to be what miners on the Comstock would call a chimney of a ledge, which may become well defined at a few hundred feet depth. The distance now from wall to wall, if such they may be called, is one hundred feet or more—the space within being broken up with quartz, clay, and bed-rock thrown confusedly together as if Nature had forgotten that "order was her first law." But even here, in what seems "confusion worse confounded," there is a law which, when rightly interpreted, will prove of more value, financially, than *poor laws* or protective tariffs. Yet, men are daily met too wise to learn; while a single branch of mining—say, for instance, the best mode of working our sulphurets—could occupy the lifetime of the wisest, without being fully mastered. Although not given to prophesy, it requires no seer's vision to read the signs of a highly remunerative future opening up to the miner, and one as enduring as the rocks on which the golden letters are everywhere imprinted.

SLYGER & CO.

Have a quartz claim of 300 feet on Mosquito Point, four miles northerly from Greenwood, and one and a half from the Grit claim, with an incline of forty five feet following the lode which is from four to five feet in width, with a pay vein of twelve inches, out of which they took in one month $1,600, and not long since, in one week, fifty-two ounces, simply with a common hand-mortar. They have run also a tunnel of fifty feet along the ledge south, commencing at a point where it cropped out in a ravine, and taken out in the same manner from $400 to $500 in a short time. They have in this way, with two men, within one year realized out of their little claim upwards of $6,000, and have about 150 tons of quartz on their dump ready for crushing, which very much resembles the rock at Gold Hill, Nevada, in color, texture and general character, and far surpasses in respect to the amount of gold to be seen with the naked eye. My friend Slyger, as if to tantalize me, showed me a box of beautiful specimens, assorted for the mortar; I felt almost sorry they were about to be turned into twenties. The miser prefers art; give me nature.

I had almost forgotten to mention that there is a good mill-site convenient to the mine, with any quantity of wood and water that could be desired. Climbing up some 300 feet above, you reach the hydraulic claim of Davis & Co., which I must pass with a single remark, viz. $12,000 were taken out last season, in four months. I should also, if time permitted, say something of the lava beds around Georgetown, giving some account of the vegetation buried sometimes more than 100 feet beneath them, of the underlying gold deposits, which would be of some interest, perhaps, to the botanist, geologist and mineralogist, but I find myself even compelled to suppress notes as to Georgia Slide, Bottle Hill and other important points for want of space.

About two and a half miles northeast of town, on the trail leading to Volcanoville, I visited the claim of

THE CLIPPER GOLD AND SILVER MINING COMPANY,

In length 3,000 feet, and running in a northerly course. The ledge, as seen at the mouth of one of their inclines, is well defined, being about three feet from wall to wall, and having a pitch to the east of 40° from a perpendicular. Gold could be seen without the aid of the glass in some of the quartz from the dump, and the pay vein, as I learned from Mr. Sornberger, the Superintendent, is at least twenty inches wide.

Three shafts have been sunk to water level, each seventy feet or thereabouts, and two inclines have been run, following the lode to about the same level, where water was again reached, and the work stopped for want of means to purchase machinery for hoisting. Some $10,000 were taken out of the mine before reaching water, a large portion of which has been expended for labor and in the erection of a 10-stamp mill. It paid $15 per ton. This yield would probably have been much greater, had pans been used instead of copper-plates, as a considerable quantity of gold was afterwards found in the tailing. If it does not pass into the hands of New York capitalists prior to the 1st of June next, the company will secure an engine and resume work.

VOLCANOVILLE

Also has its quartz ledges, only one of which can now be described. It is situated in Quartz Cañon, divided into three claims of 4,800 feet each, known as the Yellow Jacket, Josephine and Confidence. It is from four to sixteen feet in width, and as it is one of the historical ledges of the country, having been noticed, I believe, by Prof. Blake as early as 1850, I shall be as brief as possible. The original discoverer, I understand, at that time obtained from it in one month $10,000. In 1855 it was again worked by Mr. Jos. Nouges and the late Col. E. D. Baker, at which time it yielded handsomely as to amount, but did not prove profitable to its owners, in consequence of the high price of labor and want of experience in the reduction of ores, and in the different methods of working. Mr. Nouges, in conjunction with Mr. Jos. Trench of Gold Hill, Nevada, now has charge, and is running a tunnel, following the ledge, and taking out quartz which looks well, with gold visible in much of it to the naked eye, and so flattering are the prospects to the present owners, that they are saving the rock, and making preparations to erect a 10-stamp mill without delay.

THE WOODSIDE CLAIM,

Located in the center of Georgetown, is perhaps attracting more attention now, and deservedly too, than any in the county, on account of the owners having recently struck exceedingly rich ore; there is no mistaking it. If the gold had been coarse, I should have had my doubts, (I have been deceived more than once); but on the contrary, it is, most of it at least, very fine and well diffused, through a lively blue quartz mixed with sulphurets, a specimen of which Mr. M. A. Woodside will send you, and out of which $100 were yesterday pounded. The above named gentleman in March, 1863, found some quartz, which proved to be a spur, on being followed twenty feet from west to east and having a shaft at that point put down forty feet, he struck the main ledge, bearing northerly. Out of this shaft, afterwards sunk eight feet deeper, $3,000 were obtained, which must have yielded largely to the ton, as the lead, where I saw it, cannot be more than two or three feet wide. This was in an incline since run 133 feet, intersecting this same shaft, and entered thereafter some seventy feet further. The company have put up a 5-stamp mill and laid down on the side of their incline a force pump of 6-inch bore, which getting out of working order, put a stop to the work for some months. They resumed operations last January, have now some sixty or seventy tons of first class ore ready for the stamps, and soon, as we have every reason to believe, their efforts will meet a rich reward.

If this company is successful (and there is scarcely room for doubt), a new impulse will be given to quartz mining in all this region—*the thing* most needed—as few, if any claims can be called prospected. As new developments are made from time to time, the community will awake to the realization of the wealth over which they have so long slumbered, and the streets of this place will once more be thronged with busy crowds as in other days.

Hoping this and much more for your numerous friends here, I remain as ever, your faithful

Prospector.

Georgetown, March, 1866.

[Written for the Mining and Scientific Press.]

More About Sodium Amalgam.

Messrs. Editors:—Much has been said, and many experiments have been made, by myself and others, in amalgamating with sodium. In the course of these experiments I had brought to my knowledge, by Prof. Filmer, a celebrated electrotyper, a fact (the results of which I had long known and acted upon, but never before was aware of the cause) that I take pleasure in communicating, hoping that it may be of the same benefit to my fellow miners that it has been to myself, viz: That all polished metallic powders, or bright metallic surfaces, are coated so intimately with (so to speak) infinitely fine particles of air, that it is very difficult to wet them; and in the case of metallic powders, such as bronze or fine bright gold, almost impossible to settle them in water, for the reason given above; and in the case of the latter, if it is not wet it is not easily amalgamated. Potash or a caustic alkali has been found to remove this difficulty, and allow the powders to precipitate, and bright metallic surfaces to be wet. Take, for instance, bronze powder and put it in a glass partly filled with water, it will be found almost impossible, if not entirely so, to wet and precipitate it. Now add a solution of caustic potash and the difficulty is removed. The same will be the effect on a polished steel blade.

I have found in working sulphurated ores on a large scale an almost identical result, whether using sodium amalgem or caustic alkali, in both cases finding not only the bright sulphurets amalgamated, but also the pan on parts where there was any trituration.

What is the result of exposing sodium to the action of water? Certainly a strong alkaline liquid from the hydrate of protoxide of sodium, or soda, that is dissolved.

Sodium amalgum decomposes water rapidly, absorbing the oxygen and freeing the hydrogen, as can be seen by putting a little sodium amalgam into a test tube and filling the tube with water.

Of one thing we are certain, a strong solution of potash or soda attacks such metals as lead, tin, zinc, etc., and if they are in "solution" in the mercury, if no other result follows, the mercury is made more nearly pure, and is much more active.

If in the use of sodium, amalgam and caustic potash, the results are the same, which I have found without exception in gold-beering ores, (I have not tested them on argentiferous ores), which is the cheaper? It may pay for others to experiment and see if the results will be the same as they have been with

Israel W. Knox.

Golden State Iron Works, S. F., April 4.

Salt Lake.—The Salt Lake *Vedette* says: We recently witnessed assays of ores from the surface of four ledges in Rush Valley, thirty-eight miles from this city, which yielded from one to six hundred dollars per ton. The ore was argentiferous galena. When we consider that millions of tons of such rich ores, easy of access, are the prize awaiting the capitalist, we can form some idea of the vast wealth and power that will at no distant day be here concentrated.

Corbett's Roasting Furnace.

We find the following in the Reese River *Reveille*. The description given of the roast-apparatus itself is very imperfect, and we can say but little as to its probable value. The method, however, would seem to be free from some of the objections that attach to that of Keith. We give it for what it is worth:

The roasting furnace invented by Joseph Corbett, of which we published an account on the 10th instant, seems to be attracting much attention. Whether this interest arises from a perception of the intrinsic merits of the invention, or from the economical defects of the present furnaces, we are unable to determine; but it is certain that the interest exists. The small crude furnace which Mr. Corbett erected in this city for the purpose of testing and illustrating the principle, has been visited by agents and superintendents of eastern companies, as well as by persons recently arrived from the east, for the purpose of witnessing its operation and judging of the feasibility of the plan. That the present cost of roasting our ores is a serious hindrance to the development of valuable mining property, is patent to every one; and that a more economical method is essential to full and complete success is equally palpable. Mr. Corbett's plan seems worthy of the earnest attention of all concerned in milling and mining. He claims for his invention efficiency and economy, and that while it possesses these qualities its construction will not cost more than the furnace now in use. We will give his estimate of the expense of roasting twelve tons of ore in a day in a furnace of his construction, contrasted with the cost of roasting a similar amount by the present method. Corbett's furnace would be twelve feet long by eight feet wide, through the center of which would extend longitudinally a hollow shaft, provided with arms holding peculiar shaped shovels, also hollow, and kept constantly filled with water. The oscillation of the shovels would keep the "pulp" in lively motion, while their spiral fashion would also give it a longitudinal direction, and the whole mass would thus be brought into incessant and uniform contact with the flame.

According to Mr. Corbett, a furnace of these dimensions would receive a charge of four tons of ore, which would require, say about eight hours in roasting; although the inventor claims that, owing to the incessant and thorough motion of the pulp, and the action of the flame upon the entire body, the process would be effected in from five to six hours. Ten minutes would suffice to discharge and recharge the furnace. Three charges of four tons each, would give twelve tons in twenty-four hours. One man only would be required on a shift of eight hours; three men at $4 per day would give $12; and three cords of wood, at $10 per cord, would amount to $30; making the total cost of roasting twelve tons of ore only $42, or $3.50 per ton. And the economy of Corbett's plan has a wider scope than this, as in the construction of his furnace the boiler would form the head or arch of the oven, the same fuel would generate the steam necessary for the propulsion of the machinery required in crushing and amalgamating. In contrast with this estimate we will give the expense of roasting the same number of tons of ore in ordinary furnace. A 10-stamp mill is furnished with four roasting furnaces, each of which is capable of holding 1,000 pounds at a charge, (and this, by the way, is an excessive estimate, as the average charge is about 800 pounds,) and requiring the unremitting labor and attention of two men on a shift of six hours. Each charge needs about eight hours' roasting, giving one and a half tons to each furnace in twenty-four hours, or a total of six tons per day, requiring the labor of six men at $4 each, or $24 daily. At a moderate estimate each furnace would consume one cord of wood per day, and four cords of wood at $10 per cord would be $40, which, with the labor, would give a total of $64, as the expense of roasting six tons of ore. At these figures, twelve tons would cost $128, or nearly $11 per ton. And the experience of millmen shows that the actual expense is nearer $20 per ton.

Killed by Wild Flowers.—In Santa Clara county, on Sunday, a child of Jose Nelasco, aged one year and a half, was sitting in her mother's lap, when its sisters came in with some wild flowers, which they had gathered on the hills. On crying for them, the flowers were given it, when it naturally put some of them into its mouth. In a few hours it was seized with convulsions, white foam appeared at its mouth, and in a short time the child died.

The iron and steel trade of Pittsburg, Penn., is worth $20,000,000 a year; its coal trade is valued at $9,000,000, and its oil refineries turn out $10,000,000 worth of refined oil a year.

SALES OF THE WEEK

BY THE S. F. STOCK & EXCHANGE BOARD.

Friday, March 30.

AFTERNOON SESSION.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, April 7, 1866.

The condition of the money market is unchanged, and capital continues abundant at rates current for some time past—1@1¼ ₱ cent. per month. A meeting of the Trustees of the Bank of California hes been celled, to increase the cepitel stock of that corporation to FIVE MILLIONS OF DOLLARS, and to alter its by-laws in reference to the transferring of shares of stock. It is understood that the accumulation of undivided profits amounts to $1,000,000, and that $2,000,000 of the new etock will be offered to the public, at a premium of 25 ₱ cent., with a view to popularize the institution, as well as to enlarge its sphere of operations generally.

Receipts of treasure from the interior have been light this week, and since Saturday lest inclusive, amounted to less than $750,000. Bullion is in good supply, and the demand for gold bare not active, at about 840. Silver is selling at 1@1½ ₱ cent. premium for bars of average fineness.

The Mining Share market continues to attract a good deal of attention, and the recorded sales this week are nearly up to the average of the pest two months. Mostly all leading stocks have been well maintained, and are firmly held at the close. The present appearance of a number of claims is still favorable, and their prospects for the future are probably better than could have been reesonably hoped for a short time since. City shares are in better favor, and some have advanced materially.

Crown Point met with trifling sales at $1,390 and $1,410, buyer 30 and eold yesterday at $1,410@1,400. During the week ending March 31st, 575 tons of ore were extracted from the mine. The ore in the incline from the 300-feet level is said to be looking extremely well. The main lode is now developed a distance of 240 feet from the north line. The main shaft has attained a depth of 375 feet. Receipts of bullion for the month of March exceeded $148,000. A dividend will be declared on the 10th instant, leaving a large surplus in the treasury of the company.

Savage rose from $1,050 to $1,085, receded to $1,060, rallied to $1,090, and was then dealt in at $1,052@1,055. No ore has been taken from the 6th level this week, but the Minnesota mill has been kept running upon ores from other portions of the mine. No settlement has been made with the Hale & Norcross company with reference to the boundary line of the two claims. Negotiations are pending however, end it is thought that a satisfactory arrangement can be arrived at without resort to litigation.

Hale & Norcross advanced to $1,020, buyer 20, dropped to $970, rallied to $1,000, fell to $930, and sold yesterday at $945@935. Every portion of the mine in the 700-feet level is said to look well. Receipts of Bullion last month amounted to some $70,000, and a dividend will be declared on the 10th instant. A net profit of about $45,000 is now at the credit of the company. The ore crushed during the month of March averaged $38@$40 per ton.

Gould & Curry has been inactive at $1,040@1,060, and was held at the close at $1,050, ex-dividend of $80 per foot paid yesterday. The yield of the mine last month was $174,096.46 from some $3,700 tons of ore, the company's mill having crushed 3,450 tons. A considerable surplus will be carried forward after the payment of the dividend.

Yellow Jacket was in decided request eerly in the week, rapidly advancing from $850 to $1,010, then receding to $850, rallying to $855, buyer 30, and selling yesterday nt $840@862. The latest officiel report from the mine (to the 19th March) states that 1,052 tons of ore were extracted during the week ending at that date, the yield of bullion being $23,172 for the same period. It is said that eome valuable ore has been found on the eouth mine, and that the general cheracter of recent developments is quite favorable.

Ophir has been largely dealt in, and eome 4,000 feet changed hands advancing from $700 to $770, declining to $735, then selling at, $750, and closiug at $745. The main lode (9th gallery) has now been developed 35 feet north, and some 20 feet to the south, with a stope of about 25 feet, the vein of ore in the latter showing a width of 21 feet. The drift to the west through vein matter (clay and quartz) is in some 40 feet. A little trouble was experienced this week with water from the west clay wall, but no further difficnlty is apprehended. From recent crushings $65,000 in bullion has been received.

Chollar-Potosi has not fluctuated materially, and some 250 feet were sold, receding from $390 to 370, advancing to $400, buyer 30, dropping to $382, and selling yesterday at $385@390. The Pinte Station has been somewhnt variable of late, but is now looking well. The upper stope of the Bujazette ground also looks well. The stope, over heed of incline, which has, for some time past, furnished about one-helf of all the ore taken from the mine, has deteriorated recently, and the Station 60 feet below the Potosi tunnel is also looking less flattering than formerly. The Grass Valley Station has improved a little. During the week ending March 30th, 1,030 tons of ore were sent to custom mills, and 93¾ tons were sold at $8 per ton.

Alpha rose from $405 to $490, receded to $480, and then sold nt $450. There is no new feature in this claim.

Belcher advanced from $330 to $365, dropping to 350, and selling yesterday at $365@355. Between the 3d and 4th levels, within abont 200 feet of the Crown Point line, a body of ore has been met with, and in going north it is said to look well. An assessment of $60 per shere was levied March 30th.

Empire Mill and Mining was dealt in within a range of $215@195, closing at $200 bid. There is nothing new to report from this claim, but it is thought that its prodnct will show a material improvement this month.

Imperial rose to $144, declined to $137, and sold yesterday at $137 @140. The last "clean up" from the Compeny's two mills emounted to $22,268, meking an aggregate of $47,664.72, for the month of March.

Bullion was dealt in at 110@115, closing at $116 bid. Overman rose from $67½ to 75, fell to $65, and then sold at $68. Confidence rose from $37 to $59, buyer 20, then sold at $46½, closing at $40.

North Beach and Mission railroad rose from $53 to $60, and is now held at $60. Spring Valley Water has advanced materielly, end sold at $70. Union Insurnnce was sold at $115. California Steam Navigation at $57; and California Home Insurence et $102½. Pacific Insurance is in request at $172.

The aggregate recorded sales of Stocks since Saturday last, were $1,019,817.

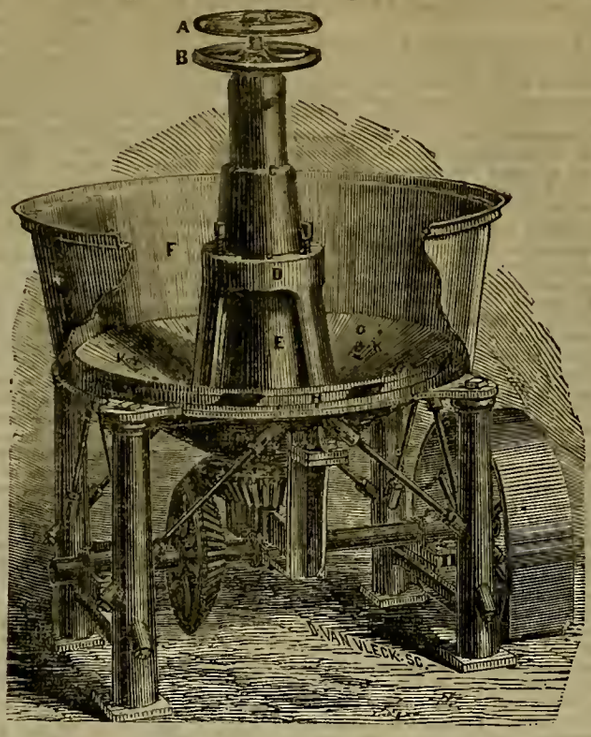
HEPBURN & PETERSON'S PANS AND SEPARATORS.

For Reducing and Amalgamating Gold and Silver Ores.



We invite the Mining Public to examine the record of our Machines before adopting any other for producing similar results. They have been in general use for the past three years, during which time they have been repeatedly tried in comparison with every other machine of note, and of a similar nature, and have invariably been adopted in preference; which facts we offer as the most suitable recommendation, and which is attested by the following list of

Principal Mills Using them:

Names of Companies.	Location of Mill.	Names of Companies.	Location of Mill.
GOULD & CURRY	Virginia City, Nevada.	TEAKLE, ROGERS & CO	Nevada.
SILVER STATE REDUCT'N WKS	Empire City, "	MELVILLE KELSEY	Silver City, "

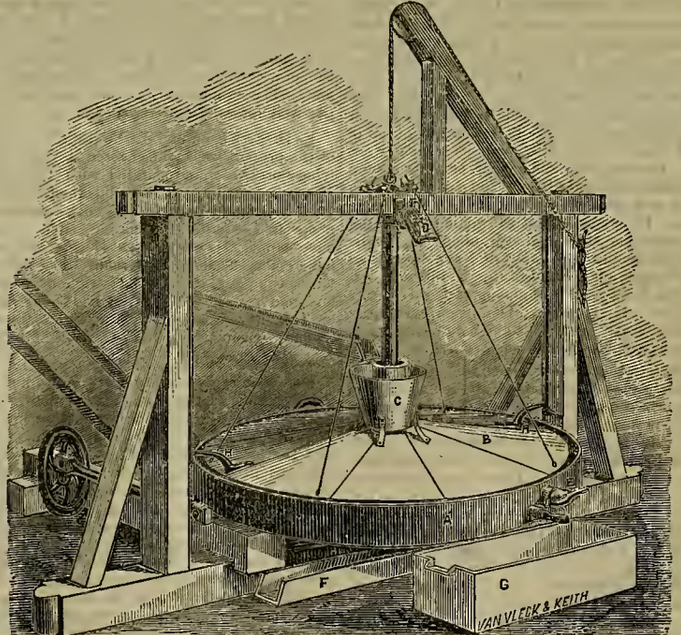
Manufactured at the Principal Foundries in San Francisco.

HEPBURN & PETERSON,

5v12tf At the VULCAN IRON WORKS, Nos 137 and 139 First Street, San Francisco.

NOTICE TO QUARTZ MINERS.



Hendy's Improved Patent Self-Discharging Sulphurets

PRATER CONCENTRATOR

. Is Receiving Universal Favor.

Reference is made to the following Mills which are using the Prater Concentrator, with some of the improvements attached. The Self-Discharging Sulphurets has been more recently adapted, and the public attention is called to examine its workings:

STEPHENS' MILL, Humboldt County, Nevada.
CHRYSOPOLIS MILL, " " "
U. S REESE RIVER MILL, Austin, "
CARROL & ASPINWALL MILL, Reese River, Nevada.
UNION MILL, El Dorado County, near Mud Springs.
NEW YORK AND EL DORADO CO., " "
BLUE LEDGE MILL, near Spanish Flat, El Dorado Co.
CONEY MILL, Jackson, Amador County.
Messrs. TUBBS & CO S MILL, San Andreas, Amador Co.
WINTER'S MILL, Angels Camp, Calaveras County.
CLIO MILL, Jacksonville, Tuolumne County.

And in use in other parts of this State; also in Idaho, Arizona, Colorado and Mexico.

As a further evidence of its worth, orders have been received recently from the proprietors of the following mills, all of whom are using these Concentrators, or have works in the immediate neighborhood of mills using them, viz.:

One Concentrator ordered for the Coney Mill, Jackson, Amador County, by Messrs. Bigelow & Bro., of this city.
Three Concentrators for the Spring Hill Mill, Volcano, Amador County.
Two Concentrators for the Golden Gate Mill, Volcano, Amador County.
Four Concentrators for the Raw Hide Ranch Mill, Sonora, Tuolumne County.
They may be seen in operation at the GOLDEN STATE FOUNDRY, No. 19 First Street, San Francisco.

☞ For explanation of the above engraving, and other particulars, send for a Circular

Mining Summary.

CALIFORNIA.

MONO—*Bodie District.*—The most cheering accounts are daily received. The monthly shipment of bullion from the Empire mine shnwe a steady increase of the precious metals. The Superintendent of the company anticipates hy tbe opening of the spring (sey May) to be able tn forward to their heed officer at New York donble tbe amount nf bullion from this mine that has heen shipped during the last year. I have no doubt of the result from a recent examinetion of the mine, togetber with the experience of the past year in treating the ore, as well as new and important improvements and appliances that will soon be brought into ective operation in reducing and amalgamating the ores.

The Homestake Consolidation cleims are situated on the southeast side of High Peak, while their mine is at the foot of the hill on the west side. This company have now in active operation three shafts, and are taking nut eome of the richest ore that I have ever seen on this side of the mountains, (not selected.) The whole vein, taken out from casing to casing, will pay not less than $200 per ton. This figure may seem rather high to many of your readers, but I am satisfied, should they make an examination, as I have, they will more than confirm this statement. All of the bullion taken from this district averages about ten dollers per ounce. The Crescent, located some two years ago, ie one of the most valuable in the district, and is favorably situnted between High Peak and Bunker Hill; the former on tbe west and the latter on the east; tbe Empire on the north and tbe Homesteke on the south. The proprietors of this fine location claim one eurface claim of 200 feet square to each locator, with the right to all gold, silver and copper veins, and all other minerals, with all their dips, engles, spurs and feedere, that may bc fonud in said location. The area of this plot of ground is 400 foet wide and 1,000 feet long, and is prominently marked out by having erected at each corner euitable posts, threc feet high. upon which is elegibly marked the names of the locators, the date of the location and the number of feet by each locator. The company recently commenced a perpendicular shaft of the largest eize, about the centre of their group of claims, and have now reached to the depth of 160 feet, at which point they struck bed rock. Upon penetrating into the rock they found a fine looking ledge of pay ore. The company are now preparing to sink fifty feet deeper, at which point they will run drifts at right angles for the purpose of exploring the entire piece of ground.

Columbus District.—Was first discovered in the latter part of the summer of 1864, by a party of Mexicans, and from that time up to the latter part of 1865 l ttle or no work was done on the ledges except for the purpose of securing a few specimens and what was necessary to comply with the mining laws in regard tn locations—consequently it is not in a very forward state nf development. The deepest ehaft in the district at the present time is not nver twenty-five feet deep. This district is situated about seventy-five miles in an easterly direction from Aurora, and nbout thirty five miles east of McBride's Ranch. The principal ledges are the Revenue, Buluarte, Ural Mint, Dumay, Yellow Jacket, Nightingale, Baltic, Stamp, Mitchell, San Jose, Cincinnati, San Pablo, and Tesora. The ore in this district is somewhat similar to the Hot Spring and Montgomery ores in its component parts. The thickness of the ledges varies from fifteen inches to five and six feet. The formation is granite and slate, the latter overlupping the granite formation from three to twenty feet. The village of Columbus contains from thirty-five to forty cabins. There are now employed between fifty and sixty men in opening out and developing the mines, and rich strikes may be looked for during the coming summer Plenty of water is readily found hy sinking from two to ten feet anywhere in the vicinity of the village. Wood for fuel purposes and fresh water have not been found nearer than fifteen miles nf the camp. An immense basin of salt lies ahout two miles east of the town.

Lone Mountain.—Exceedingly rich mines have been found by some Mexicans at Lone Mountain, thirty miles northeast of Silver Peak, in the eouth-west part of Nye county.

The Governor and his party left here on Friday morning last, accompanied by an escort of twenty U. S. Cavalry. Among others I noticed Hon. John Vandewater and Hon. John C. James of your county; also, Senator Lambert of Washoe county.—*Aurora Correspondence of the Virginia City Enterprise.*

PLACER COUNTY.—We learn from the *Enquirer* that the Badger Hydraulic claim, near Dutch Flat, cleaned up, the other day, as the result of a fifteen days' run with four hands, the sum of $3,000. It is held in thirteen shares, and the amount above will pay, after deducting expenses, ebout $150 per share. The Rough and Ready, in the same vicinity, cleaned up $2,500 as the result of fifteen days' washing.

A Rich Strike.—Last week a ledge was located on the lot of C. A. Tuttle, Esq., by Judge Fellows. H. H. Fellows, Walter Fellows, and three or four other fellows, which prospects immensely. Rock taken from a depth of four feet, and assayed by Dr. A. A Veatch, yielded at the rate of $447.40 to the ton. The rock would not be taken for mineral rock by a novice, but it is undoubtedly rich.—*Auburn Stars and Stripes.*

An immensely rich quartz ledge has lately been discovered in tbe Fuir hydraulic claims, at Gold Run, Placer county. Several nuggets have been found, varying in value from five to twenty-five dollars.

Nearly all of the original owners of the Pacific lead, below Ophir, have disposed of their interests at prices ranging from three to three dollars fifty per foot. But feet cannot be purchased in the ledge at these prices now. We understand that the best ore from tbe mine has been negotiated for by Swansea agents, and that the yield will be over $300 per ton, principally silver.—*Auburn Herald.*

Colfax Quartz.—We saw yesterday a handsome specimen of gold-bearing quartz, brought to town by J. H. Neff, Esq., from the Rising Sun ledge on Bear River. It was beautifully besprinkled with free gold. On Monday fifty feet of the ledge were sold for $5 per foot. *Stars and Stripes.*

The Dutch Flat *Enquirer* learns that the quertz excitement in the vicinity of Colfax continues unabated. The ledges are situated near Bear River, and almost immediately on the Grass Valley road. Many are confident that the ledges are the continuation of the Grass Valley series. The rock bears a striking resemblance.

TUOLUMNE COUNTY. — We have some wonderfully rich float rock this week, picked up near Shaw's Flat, in which vicinity, at various times, have been found considerable quantities of the same character of quartz, evidencing that somewhere in the neighborhood is a lead of fabulous wealth.—*Sonora Courier.*

SHASTA COUNTY.—The *Courier* says that we are pleased to notice that Jones & McCall's claim is producing rock rich in sulphurets, resembling the Muletown product. We believe this lode is going to prove very rich; but if it will pay only eight dollars per ton, it will be an immense fortune to the owners. It is six feet wide, and so easy of access that the expense of taking it out will be comparatively nothing for yeare to come.

The Kellinger Mine.—A correspondent of the Shasta *Courier* writing from Copper City, says: The indomitable Gooch has melted twelve ounces of silver and gold from forty pounds of Kellinger rock. The Kellinger lower tunnel is now in eight hundred and fifty feet, and is in what is considered case rock. The upper tunnel is probably nearer the ledge than the lower one, and the rock is somewhat harder but of the same kind. It is the same kind of rock that the Bully Hill company stopped work on. It shows iron and copper sulphurets, and assays in gold and silver. Some of you Shasta folks may think we will not strike a good ledge here. It may be so, but we would rather think of seeing the sun stand still upon Tay Bully, and the moon in the valley of Narwarket, than not strike a good ledge in the Kellinger. After the Kellinger, the labnlous riches of Bully Hill will be opened. Then men will say: "What a fool I was not to hold on to my feet!" Such is life, Mr. Editor, such is life.

PLUMAS COUNTY.—From the Quincy *Union*, we learn that Messrs. King, Neesman & Co., who own the quartz ledge discovered near the Sulphur Spring Ranch in Mohuwk Valley, last fall, have been crushing some of the quartz from the ledge, in an arastra. The rock pays about $20 to the ton. They think they are on the main lode, and have already taken out enough paying quartz to keep one arastra running all summer. If the rock continues to pay as well ae it does at present, a mill will be built on the ledge this season. Two other ledges have been discovered near tbe above ledge, which prospect fully as well.

CALAVERAS COUNTY—*The Keystone.*—The Copperopolis *Courier* says that the strike recently made in the new shaft of the Keystone claim bids fair to be an important one. In tbe bottom of the shaft, which is about fourteen feet in depth, is a handsome lead about two feet wide. The lead is widening materially toward tbe northwest, and may lead to a large and valuable deposit of ore.

Copper Ore.—C. T. Meader & Co. shipped yesterday, March 31st, 1866, by steamer, 127 sacks (13,970 pounds) of Union mine copper ore. The sloop Dorinda carried off eixteen tons of Keystone mine ore, shipped by R. B. Parker & Co.—*Stockton Independent.*

MARIPOSA COUNTY—*Copper.*—The Stockton *Independent*, March 31st, says: Two hundrod and ninety bars, or pigs, of smelted copper, brought from Phillips & Haskell's smelting furnace on the Buchanan lead, at tbe head of Chowchilla creek, Mariposa county, is now at the store of J. Pache & Co., commission merchants, Levee street. The lot weighs 17,612 pounds, and the metal assays about ninety per cent. of pure copper. A letter from the mines, received by a gentlemen in this city, says that the discoveries recently made on the Buchanan lead proves it to be one of the richest mines found in the State. At a depth of sixty feet, the vein of ore is five feet wide, and the mineral is of an oxtraordinary rich quality. Astouishing developments will undoubtedly be mede in that section of the country next summer.

With the new furnaces, it is claimed thet ores averaging five per cent. can be made to pay, and that with a furnace costing $3,000, three tone of copper bars a day can be reduced from the orcs. The new furnace is eucased in water, which prevents the breaking, cracking and warping from heat, so common in ordinary furnaces. The copper reduced by this furnace will cost $30 per ton, and the expense of sacking and transportation of ores is seved. It is claimed that the machinery of the new furnace can be put up in ten hours' time, after its arrival on the ground. The cupola of Haskell's furnace was cast at the Golden State Iron Works, in this city; and Coffey & Risdon manufactured the wronght iron casing. A pile of copper bars, from the furnace, may be seen at Coffey & Risdon's shop, on Market street.

NEVADA COUNTY.— Regsdale & Co., bave struck an immensely rich ledge, about one mile southwest of the Globe ranch, near the celebrated Stockton lode. They have been taking it out rich for several days past, but on Saturday struck it richer than ever, and took out over $1,000 in a few hours.

Arastras.—The Grass Valley *National* is informed that Wm. Eberlin & Co who own the Bunker Hill ledge which bas been worked for six or eight months, and has paid as high as thirty dollars a ton, are now engeged in putting up two arastras, near Rough and Ready, to work their rock. For some time past the rock from their ledge has been crushed at Smith & Co.'s mill, near the above place, but the owners of tbe ledge, thinking that more gold could be saved by using arastras in crushing, have been induced to put up two and try them. Water power will be used to run the machinery.

ALPINE COUNTY.—*Rich Assay.*—Judge Burbank, of Virginia, who by the way is again with us looking after his mining interests, lately had five different pieces of rock from the croppinge of tbe George Law claim assayed at Virginia. They ranged from $181 to $1,394 to the ton. The highest assay was about $900 in silver to $500 in gold. The George Law is owned by Judge Burbank and a few other citizens of Virginia who are so well satisfied with the claim that they contemplate the erection of a 60-stamp mill during the coming summer. The croppings are immense and will pay well for working.—*Chronicle.*

E. H. Errickson and J. Smith, the forepart of the present week, discovered a new ledge lying northwest and parallel with the Wide West Co.'s claim. It is well defined, having a bold, continuous outcrop, the rock from which looks fine — exhibiting native silver. They have named this claim the "Desperado," and have commenced work thereon. The General Grant company, Raymond district, have some fine gold bearing rock They had penetrated, on Thursday, four feet, with no indications of a back casing, or wall.—*Silver Mountain Bulletin.*

The Monitor *Gazette* says: Workmen on the Merchant's ledge have cut in about seven feet, and the ore looks better as they get in. They are 500 feet under ground in this lode, and the amount of ore which may be sent to mill is almost unlimited. Mr. G. G. Payne, of this place, has been quietly engaged during the winter proving up and testing the value of the Sailor lode, up the cañon between here and Mogul, and as quietly securing to himself the title to the same. From the different assay bills we have seen of this ore, ranging from $11 to $138 per ton, and from the width and general permanent appearance of the lode, we think we are justified in concluding that Mr. P. has a good thing.

The superintendent of the American Mining Company, finding the work of pumping out the shaft both laborious and expensive, has put a dam across Monitor creek, above town, for the purpose of taking out the water to be carried in flume to the works, where it will be made to turn a twenty-foot overshot wheel, which will be geared to the pump and perform a service.

In Alpine District, the St. Helena Company, near the head of Indian creek, have been at work all winter, and a few days since struck ore to encourage them wonderfully. The Good Hope Company will resume operations again in a short time, hopeful of showing milling ore at no distant day.

SIERRA COUNTY.—A correspondent of the *Mountain Messenger*, writes from Newark, in the north part of the county, as follows: The late rains have filled our ditches with the precious fluid, and our buckskin purses with precious dust. Every man here is employed. The Nevada claim is paying very well at present. Mr. Martin Perkins, who left here last fall with a large fortune accumulated in this claim, returned a week or two since, and placed the boys again on the lead they had lost in his absence. The Swiftsure claim, Miles Schofield proprietor, turns out a wonderful supply of dust weekly, owing to the good management and persevering energy of Mr. S., though he labors under many disadventages. The North American claims are paying well, and give employment to a large number of men. The claim consists of sixteen sheres. The Boston claims, Charles Kenny & Co., are paying from six to eight dollars per day to the hand, working through an incline and washing their gravel the year round. The Vermont claims, C. O. McQuestion & Co., struck it rich last week—as high as twenty five dollars per car load. Mr. J. P. DeNoon is prospecting the old Reading ground. Success, I hope, will ultimately be his reward. The Phœnix claims, Sutherland Brothers proprietors, pay largely, employing twelve or fourteen hands, In the Washington, Rutledge & Co., there has been no washing done since last fall, but a large pile of evidently rich gravel is accumulating for spring. It is with regret that I state the Gem is worked out, so we shall place her on the list of the dead. She has done good service, and contributed largely to the prosperity of this camp.

Another correspondent of the *Messenger* gives the following from St. Mary's District:

The mines were discovered late in the fall of last year by parties going to Excelsior. They lie directly on the Henness Pass and Sierra Valley road, about twenty-five miles from Summit City. There have been some thirty-four claims located, and work has been going on all winter on some of them.

The United States Company, General Grant ledge, have sunk a shaft to a depth of 50 feet, and rock taken out from that depth assayed in gold, $54.15; silver, $12.10—making a total per ton of $76.25.

The American Chief Company have a shaft down twenty-five feet. The Abe Lincoln and Little Savage Companies working on the Rochester lead, have each a shaft about twenty feet deep. Top rock, taken from the Warner Company and Sampson ledge, assayed $15.73, silver and gold. The Young America Company, Monumental ledge, have a shaft fifteen feet deep.

Lumber can be had here at fifteen dollars per thousand, and wood and water are plenty. The cost of working the ores here will be trifling. There are two towns laid ont at the present time, one called Spring Garden City, at the junction of the Henness Pass and Sierra Valley road, and within a short distance of the mines.

WASHOE, NEVADA.

The Virginia City and Gold Hill papere report favorable indications from various quartere this Spring. The leading companies seem to be finally ready to take hold of the great Sutro-Comstock drain-tunnel. Recent strikes of abundance of rich ore at great depths are having a brightening effect. Besidee the facts stated in the weekly stock reports, on another page, we clip the following paragraphs from the *Enterprise:*

The Yellow Jacket company have at present an immense body of ore of extraordinary richness. The ore appears daily to grow richer and more abundant. A large amount is being taken out. In whatever direction drifts are run within the bounds of the vein good rock is found.

Some very rich ore is being taken from the Kentuck claim, Gold Hill. The company are putting up steam hoisting machinery, when large quantities of ore will be raised.

REESE RIVER, NEVADA.

We condense the following from the *Reveille* of recent datee:

Good Assays.—J. P. Spaulding has laid upon our table certificates of assays by J. R. Murphy, of the National bank, of mineral obtained from the White Mountain district, just discovered in the White Mountains, fifty miles west and south of Silver Peak. No. 1 yielded $17.27 in silver; the Quaker City, $2,164.98 in silver; Good Intent, $12.50 in silver, $21.99 in gold; and the Waverly, $86.38 in silver, $25.01 in gold. The ore procured from the Quaker City is a rich silver glance, and that from the Waverly argentiferous copper.

The Confidence mill has been closed for needed improvements; four barrels will be added to the six tubs already in the amalgamating department, and an additional furnace erected, making four in all. Work progresses

systematically on the mine, and they are pushing the exploration and extracting ore at the same time. The company is also working the Tuscarora mine, situated in Marshall Canon, from which excellent mineral is being procured. When the mill is completed a large amount of superior ore will have accumulated, and the work of reduction will move steadily on.

New Discoveries.—Spaulding and Cahaley have been prospecting in the White Mountains, about fifty miles west of the Silver Peak district, and they discovered and located sixteen ledges, varying in size from three to twelve feet. They named the new district the White Mountain. Some of the veins exhibit gold without a trace of silver, others silver without a trace of gold, and others again contain both gold and silver in varying proportions. Many of the specimens are very beautiful, and the presence of copper has given to them the soft iridescent tints. Cahaley discovered also in the mountains forming the eastern boundary of Fish Lake, and about fifteen miles from White Mountain district, three large veins of silver-bearing mineral, specimens from which exhibit masses of dark sulphuret of silver, but he could not prospect the range thoroughly on account of the Indians—the Indians tribe—who are thieving rogues, and required incessant watching.

Crœsus District.—A new mining district, named as above, has been laid out on the edge of Death Valley, about fifty miles southeast of Silver peak. The leads are from four to fifteen feet thick, and assay from $20 to $400 per ton. There is plenty of wood and water within six or eight miles, though none is found in the immediate vicinity of the mines.

Mount Vernon.—We enjoyed, recently, the pleasure of a visit from Captain Robert Knapp, superintendent of the Mount Vernon company. The Captain is at present working the mines of the company located in the Mammoth District, numbering, we believe, seventy ledges; and he has commenced a tunnel which will cut, in the distance of 500 feet, at least fifty veins—upwards of thirty of which belong to the company. This number does not include the blind ledges. The tunnel has an open cut of 120 feet, and has been run in forty-five feet. Capt Knapp is an experienced and intelligent mining superintendent, and the enterprise he has been selected to conduct will prove one of the greatest in magnitude yet undertaken in the country.

FROM THE NORTH.

A correspondent of the Montana *Post* writes from Helena, March 1st:

Although the weather is still severe, active preparations are being made by all for Spring. In riding through the numerous gulches, one is surprised to see so much work being done this early in the season. Grizzly, and particularly Gry Gulch, show great activity, the latter being completely filled with piles of pay-dirt, one of them estimated to contain $28,000. Those who worked this gulch last season did not find the good pay-streak that has since been struck. Oro Fino Gulch is receiving a practical damming, much more effective for good than wordy efforts in the same line previously indulged in by unfortunate miners. Two profane utilizers of water, of considerable length, have been run across this gulch—one at Junction, and the other a mile above. Quartz mining is receiving more and better direct attention than ever before in this vicinity. Many miners are devoting their whole time to the development of their quartz property; and in the coming season, the rich belt of leads extending in a northeasterly and south westerly direction, across the heads of the neighboring gulches, will deserve the attention of others than "pilgrims." Worden's mill, on the Cliff extension of the Big or Crœsus lead, is finely progressing toward completion; and it will not be long before we shall know by practical demonstration whether our fifteen miles of quartz bears the same relation to all neighboring leads that the Irish girl supposed the turtle did to certain vermin, when she called it the "daddy of all bed bugs.

Another writing to the *Post* from "Pipestem Fork," says:

New lodes have been struck this winter; one, which is eight feet in width, shows the precious metal in nuggets, all over it. The Emigrant has now a shaft down some forty feet in depth, and the rock is richer than ever. Free gold can be obtained from any of the rock, and by roasting in a common fire, globules of silver can be plainly seen. When the mill gets once at work, I will furnish the returns of the amount of rock crushed and the yield per ton.

A communication in the *Post*, from Deer Lodge, says:

Quartz interests in this county are being regarded with some affection by even the most anti-quartz on the-brain people, the Butte City leads proving themselves of great richness and extent. There are some thirty loads prospected, shafts having been sunk to a depth of twenty to seventy-five feet on each. I have good authority for saying that the sum of $22,000 was offered for a claim on the famous "Rocker" lode near Silver Bow.

The Original is being developed by a New York company, and it is more than exceeding the anticipations of the lucky owners. The Alice Brown is also of great value, besides the Empire, (or "Brady," as the jumpers call it,) Vudis, Union, and a host of others, the names of which I cannot recall. From German Gulch I hear the most flattering accounts. There are about 400 miners at work, and they are all doing well. French Gulch and Silver Bow are all promising much better than it has been supposed they would, and there will be employment for a large force this season.

ESMERALDA, NEVADA.

The *Union* alludes to seeing seven bars at the express office, Aurora, from the Diana claim, at Hot Springs. The bars weighed upwards of 180 pounds, and were the result of two weeks' crushing in the company's little mill.

NEW MINING LAW.

AN ACT ENTITLED AN ACT CONCERNING PARTNERSHIPS FOR MINING PURPOSES—APPROVED.

The People of the State of California, represented in Senate and Assembly, do enact as follows:

SECTION 1. Whenever any two or more persons being owners, occupants, or locators, of any mining claim, or when any two or more persons shall have associated themselves together, with or without any written agreement, (but not as a body corporate,) for the purpose of working or prospecting any mining claim on any of the public lands of the United States, shall, after being notified in writing by any member of said mining company that they have been associated in said mining claim, be deemed to be copartners for the purpose of prospecting or working said mining claim, and shall be subject to the provisions and liabilities imposed by this Act.

SEC. 2. After a mining claim shall have been located, any person who shall be a member of the company desiring to work said claim, may notify the other members of the company of his or their desire to have an assessment levied against the owners of said claim for the purpose of prospecting, working, or developing such claim, designating a time and place for a meeting of the members of such company for the purpose of levying such assessment; such notice shall be given as provided in the fourth section of this Act, and if a majority of the shares in such mining claim be represented at such meeting, then a majority of those present at such meeting shall be authorized to levy such assessment; but if a majority of the shares in such company be not represented at such meeting, then a majority of those present shall be authorized to cause the said mining claim to be prospected or worked, and thereafter the owners in such mining claim shall be liable for their respective proportion of the expenses so incurred in prospecting, working, or developing such claim, to the extent of the value of their interest in such claim, and thereafter assessments may be levied from time to time, not oftener than once in thirty days, by any member not delinquent of said mining company, against delinquent members for the collection of sufficient amount of assessment to pay for the working and prospecting of such claim up to the time such assessment is made, and such delinquent assessment may be collected as in this Act provided; *provided*, that when the mining companies have by-laws designating what amount of work shall be done in such claim, then any assessment made as provided in this Act shall not exceed an amount sufficient to pay for the work required by the by-laws; and, *provided* further, that no new assessment shall be made until all previous assessments have been paid, or the remedies for the collection thereof shall have been exhausted.

SEC. 3. Any member of a mining company, or his heirs, executors, administrators, or assigns, in any mining claim, who shall neglect or refuse to pay any assessments, or shall neglect to perform any labor or other liability which shall become due from him under this Act, may, after the expiration of thirty days after such assessment, labor, or other liability has become due, be notified in writing by any remaining member or members, or by his or their agent, that such assessment, labor, or other liability is due, which written notice shall specify the name of such mine and the district wherein it is located, and shall particularly mention the liability which has been incurred.

SEC. 4. Such notice, and all other notices required under this Act, shall be served as follows:

First—If the party reside in the county where the mine is located, it shall be delivered to him personally or left at his place of residence.

Second—If the party reside out of the county, but within the State, and his place of residence is known, such notice shall be deposited in a post office or express office, in a sealed envelop, with postage or express charges, as the case may be, prepaid, addressed to such party at his place of residence.

Third—If such party reside out of the State, or his place of residence is unknown, such notice shall be published once a week, for eight successive weeks, in some newspaper published in the county where the mine is located, if there be such paper, otherwise, in some newspaper published in an adjoining county.

SEC. 5. If the person so notified shall neglect or refuse to pay or discharge such assessments, work, or liability, for ten days after personal service or leaving notice at his residence, when such service has been had or notice so left, or for twenty days after deposit in post or express office of such notice, when such deposit has been made, or until the expiration of the full period of publication herein provided, when publication is made, thereafter such delinquent shall be deemed to have absolutely forfeited and abandoned to the other members of said mining company, all the right, title, claim, and interest owned, held, or possessed by such delinquent in the said mining claim, such portion thereof as shall be sufficient to satisfy such delinquency; the remaining member or members may sell the interest of such delinquent member in and to such mining claim, or so much of said interest as may be required to pay such assessment or liability, together with costs of sale.

SEC. 6. All sales under the provisions of this Act shall be at public auction at the mining claim, and shall be made by any constable of the township, auctioneer, or Sheriff of the county, and by giving ten days notice thereof by posting written notices in three public places within the mining district where such mine is located. The notice shall also specify the extent of the interest of the delinquent, and the amount of the delinquency, and the name of such delinquent member or members, at the time and place of such sale, which place shall be within the district where the mine is located, and shall commence by offering the smallest number of feet or shares in such claim for sale, and continue selling at the same time and place until a sufficient number of feet or shares is sold to pay the delinquent assessment or liabilities, and the officer selling shall execute a deed to the purchaser or purchasers, and such deed shall be received in all courts as *prima facie* evidence of the lawful authority of the officer selling, and of the regularity of all proceedings prior to the execution of the deed, and as *prima facie* evidence that all the right, title, and interest of the party delinquent has been lawfully and rightfully sold and conveyed to the purchaser, and the purchaser's title to such mining claim shall be absolute.

SEC. 7. The provisions of this Act shall also apply to all persons who have refused or neglected to sign articles of incorporation or a deed of trust in any incorporated mining company.

SEC. 8. An Act entitled an Act concerning partnerships for mining purposes, approved April 4th, 1864, is hereby repealed.

SEC. 9. This Act shall take effect from and after its passage.

The Origin of Things,

GLASS HOUSES AND THROWING STONES.—In the reign of James I., the Scotch adventurers who came over with that monarch were greatly annoyed by persons breaking the windows of their houses, and among the instigators was Buckingham, the Court favorite, who lived in a large house in St. Martin's fields, which from its great number of windows was termed the "Glass House." Now the Scotch, in retaliation, broke the windows of Buckingham's mansion. The courtier complained to the king, to whom the Scotch had previously applied, and the monarch replied to Buckingham: "Those who live in glass houses, Steenie, should be careful how they throw stones." Whence arose the common saying.

"HEAR, HEAR!"—This phrase, originally "hear him," was first used in Parliament to remind members of the duty of attending to the discussion, but gradually became what it now is, that is to say, a cry indicative, according to the tone, of admiration, acquiescence, indignation, or decision.

THANKSGIVING DAY.—In 1623, after the Pilgrims had gathered their harvest, Governor Bradford sent out a party to hunt for game, "that they might furnish themselves with an abundant feast and rejoice together, after they had gathered in the fruits of their labors." So they shot the game, cooked and ate it, and also feasted Massasoit, together with ninety of his Indians. They "thanked God with all their hearts for the good world and the good things in it," and so kept their first Thanksgiving. In 1646, the venerable Governor Bradford said: "Nor has there been any general want of food among us since, to this day."—This, we believe, is the origin and history of a festival which is soon to become a national institution.

MAKE A CAT'S PAW OF ONE.—Richardson's allusion to this phrase in his dictionary fully sustains its origin as given here. He says: "Catspaw, (common in vulgar speech, but not in writing,) the tool, the instrument, derived, probably, from the fable, in which the ape employs the cat to pick the chestnuts from the hot coals with her paw, while he is quietly cracking them."

This fable is related in a story of a cat and monkey, in a "Voyage Round the World, by Dr. John Francis Gemelli Carreri, 1695." The doctor was told by D. Anthony Machado de Brito, admiral of the Portuguese fleet in India, that in order to punish a malicious monkey, he placed upon the fire a cocoa nut, of which monkeys are very fond, and then hid himself to see how the animal would take it from the fire without burning his paws. The cunning creature looked about, and seeing a cat by the fire-side, held her head in his mouth, and with her paws took off the nut, which he then threw into the water to cool, and then ate it. Hence the saying.

Commencement of Twelfth Volume

—OF THE—

Mining and Scientific Press

Published Every Saturday.

The title of our journal is a truthful expression of its character.

It affords a class of progressive information to the Miners, Mechanics and Professional Men of the Pacific Coast, which cannot be derived from books, or other publications.

Each Volume comprises, in reality, a book of new intelligence and facts relating to Mining, Mechanism, Metallurgy, Science and Art, developed by our rich and peculiar resources, and identical with our own industry and history.

By the encouragement of intelligent economy in LABOR and GOLD-SAVING, we shall make the PRESS a source of INDIVIDUAL PROFIT to its patrons, as well as a public benefit to every local community in which it circulates.

The prospects of our journal are now brighter than at any former period. Our facilities for furnishing a valuable paper are constantly increasing.

Following are some of the many opinions generously expressed by our neighbors:

Editorial Expressions:

The publishers intend to make it the "Scientific American" of the Pacific Coast. Every miner should have a copy of it in his cabin, for it will be filled with useful information for the pick and shovel fraternity.—[Trinity Journal.

Should be taken by every man owning "feet" [and brains] in this State.—[Beacon.

In no other ten journals can the reader find the same amount of reliable mining news as in the PRESS.—[Contra Costa Gazette.

Every stockholder in different mines will find it will pay to take and read this mining journal.—[Contra Costa Gazette.

The PRESS is to the Pacific Coast what the "Scientific American" is on the Atlantic. It deserves its success.—[Aurora Daily Times.

It is fully up to the times, and furnishes the latest mining improvements and intelligence.—[Calaveras Chronicle.

Every miner should subscribe for the PRESS.—[Calaveras Chronicle.

It presents a channel through which all mining notices may be cheaply consolidated into one sheet for the convenience of all stockholders.—[Mountain Messenger.

We can give our testimony that it is always replete with useful and valuable information to miners and mechanics.—[Placer Herald.

It contains correspondence from different sections, giving accounts of new discoveries in gold, silver and copper, and should be taken by every person that wishes to keep well posted on the developments of our State and the Territories.—[Mountain Messenger.

With the last number is an index to the whole volume, most useful and valuable to those who keep files of that paper.—[Shasta Courier.

Prof. J. D. Whitney's address on Mining, is given entire. * * * We preserve the PRESS, and would like to have a full file.—[Napa Reporter.

The public should support the enterprise of the MINING PRESS, one of the best papers in the State, by a liberal patronage, as it is only by a system of legitimate reports that our mines can be favorably brought before men of capital below.—[Calaveras Chronicle.

Under the management of Messrs. Dewey & Co., the PRESS has been much improved in every respect. * * It deserves a liberal support.—[Virginia Union.

A good paper for this country.—[Humboldt Register Nu.

Those who would have a good paper of this character should subscribe now.—[Marysville Appeal.

It embraces one of the finest fields in the world, and seems to improve it. * * * It will be second to no scientific record now published on this continent.—[Los Angeles News

A neat and useful journal. One of the most presentable and useful in the State.—[Sunday Mercury.

Such a journal has been needed on the Pacific Coast, The PRESS fills the bill.—[Reese River Reveille.

A splendid paper, and should have a good list of subscribers in prosperous Grass Valley.—[G. V. National.

We receive, regularly as clock work, this exceedingly valuable and interesting journal.—[Napa Reporter.

Interesting and important to miners and Mountain men.—[Butte Record.

Friends pleased with our efforts in the publication of the PRESS can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

SUBSCRIPTION IN ADVANCE.

One Year, (two volumes)..... $5.00
Six Months, (one volume)..... 3.00

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

Mr. Wm. R. Brndshaw, is our Special Correspondent and Traveling Agent. All favors or assistance rendered him in his progress through the country in behalf of our journal, will be duly acknowledged.

SAN FRANCISCO, Jan 1st, 1866.

Mr. A. C. Knox, is our fully authorized Traveling Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.

SAN FRANCISCO, Jan 11th, 1866.

Mr. Elwin Davis, is authorized to solicit subscriptions, advertising, etc., for the MINING AND SCIENTIFIC PRESS, in San Francisco, and to receipt for the same.

San Francisco:
Saturday Morning, April 7, 1866.

Look Out for Illegal Advertising!

All assessments of corporations levied on, or subsequent to, March 26th, are governed by the new law approved on that day. We notice that some of our important mining companies are advertising their assessments illegally in the daily and weekly press of this State. As the new law is more liberal in its provisions for advertising than the Act of 1864, these companies have yet time to retrace their steps and begin anew and right. We speak of the matter for the benefit of all concerned. We have prepared a set of correct blank forms for advertising assessments, which we furnish free on application at our office, together with rules for advertising and copies of the new law.

Mining Laws of 1866.

It is our intention to issue, in cheap pamphlet form, previous to May 1st, a full and correct copy of all laws relating to mining adopted by the California and Nevada State Legislatures of 1866. Some of these Acts are of vital importance to every citizen interested in mining.—April 1st, 1866.

HUESTON, HASTINGS & CO.—These fashionable clothiers are so well known in California, and in fact throughout the Pacific States, that it seems like an old story to say that they have the finest establishment in San Francisco, and are acknowledged leaders of fashion. *Our story* may be old, but *their goods* are *new*, and those who wish a stylish or becoming garment of any description, can be accommodated with a good fit, without fail, at Henston, Hastings & Co., corner of Montgomery and Sutter streets.

CORRESPONDENCE.—During the absence of our senior, we have fortunately been well assisted by our correspondents, as our paper to-day will show. We have another letter from "D" on hand, and expect another from "Prospector" next week. Mr Ewer will have something to say of Nevada county next week

THE Teachers and pupils connected with the Lincoln School, contributed the very handsome sum of one hundred and thirty dollars toward the Lincoln statue, which is to be uncovered to the public, with appropriate ceremonies, on the 15th instant.

Keith's Desulphurizing Process—Mining in Colorado.

From a communication published in the *Alta* of the 2d inst., written by a correspondent who signs himself "Argus," and dated "Gold Dirt, Colorado Territory, March 10th, 1866," we take the following:

LYON'S SMELTING WORKS,

The first ever erected within the Rocky Mountains, and, I believe, the first within the United States, for the treatment of gold, are giving great satisfaction to the proprietors. They have been paying $50 per ton for galena ores that will average 75 per cent. of lead. This was for their own use, to get litharge to be used as a flux in smelting. The process of smelting is looked upon as the very best method for treating argentiferous galena ores, and the estimated cost for suitable works (for silver ores) does not exceed $25,000. There have been extensive discoveries of silver lodes in this neighborhood, particularly at Argentine and Snake river. The latter place is west of the mountains, but so near the summit of the range that it is inaccessible during five months of the year. The ores found there are argentiferous galena, mixed with chlorides and a little antimony. If the yield should be only one-fourth as good as the assays that have been returned, it is a very "big thing." Mr. Lyon went East a short time ago, taking with him a button of bullion weighing 150 pounds. I am informed that he will endeavor to organize a strong company for the purpose of putting up smelting works for custom work in every district where there is a likelihood they could be profitably employed. If this can be carried out it will be of great benefit to miners, as custom mills are much needed.

THE GOLD DIRT LODE.

The Hope company (Baltimore capital), who last year purchased part of a celebrated lode known as the "Gold Dirt," and erected a large mill, with machinery to work the Keith Desulphurizer, at an expense of over $250,000, is cleaning up $2,000 per week, and expect to double this yield when they get all their shaking tables at work. The Keith process for desulphurizing refractory ores has cost its projectors a large sum of money, and much time and patience to perfect. It is now considered a success, and is greatly superior to anything else in the field, always excepting the old smelting process. As it bids fair to become in general use in this Territory, and is probably unknown to most of the mining men in your State, I will give you, as well as I can, a short description of the process and machinery as used at

THE HOPE MILL.

The mill is three stories high. On the upper floor, a "Blake" crusher breaks the ore to about the size of a bean. The ore thus broken passes into a ball-grinder on the floor below. This grinder is formed of a revolving iron barrel, with the staves about one-sixteenth of an inch apart. Within the barrel there is about half a ton of two pound balls to pulverize the ore until it is fine enough to pass between the staves. It is then carried by an elevator to the upper floor, where it passes on to a drying table (the top of the furnace), afterwards being scraped by a rake into a long trough, where an archimedian screw works it into an elevator, which carries it to the upper floor again. Here, after passing through a screw, it runs into an iron pipe, four inches in diameter, at one end of which is a small blower, and at the other the fire-place, consisting of a circular sheet iron stove, three feet in diameter and three in hight, lined with fire brick. This fire-place opens into a furnace. The blows before mentioned force the pulverized ore through the flames in the fire place (causing the sulphur to ignite) into the furnace, where the ore coming in continuously with flaming sparks keeps the whole mass in the furnace on fire, until all the sulphur has exhausted itself and the furnace is full. The vapors and fumes pass off through a hole at one end of the furnace, connecting with a high chimney.

The ore is then scraped out of the furnace into a vault below, and is allowed to cool. It is then carried by elevators to the second floor and fed through a hopper into small ball grinders, on the same principle described above, the balls only weighing two ounces each, of cast iron. These pulverize the ore as fine as flour, and it is afterwards put through a wire bolter (eighty meshes to the square inch) into a vat where there is a stream of water. The ore is mixed with the water by revolving combs, and the mixture then passes out of the vat by pipes on to the copper amalgamating tables, which are the shape of a washboard, and are kept oscillating by machinery. These works can, it is stated, treat forty tons of ore daily, and only require eight hands and a 15-horse power engine to run them.

MINING PROJECTS.

The success of the Lyons and Keith's methods in saving the precious metals, has caused Colorado stocks to be in a little better demand in the East, and there is every prospect we shall have lively times shortly. In a few weeks it is expected that some twenty mills will be rolling out the gold. The Naraganssett, Gunnell, and Smith & Parmelee mills are doing well. The Black Hawk company, one of the strongest in the Territory, will soon have sixty stamps going on the old process, intending afterwards to smelt the tailings in works they are going to build for that purpose. The local papers almost daily report sales of mining property in the East, and sometimes in Europe. Many of these, I am afraid, are not founded on facts, or are greatly exaggerated before they reach the sanctums of the purveyors for the press. It is not likely that many large sales will be effected before some good dividends make their appearance.

Inventions for desulphurizing ores have become surprisingly numerous of late. Unfortunately, however, most of them show a lamentable ignorance of chemical and metallurgical facts, and are as inadequate and worthless, as their inventors are positive and sanguine.

It requires some *time*, as well as full exposure to the oxidizing influence of the air at a suitable temperature, to effect a proper decomposition of the metallic sulphurets, and if the period during which each portion of the ore is exposed to such an influence, be no longer than the descriptions yet given would lead us to infer must be the case in Keith's process, the amount of desulphurization effected will naturally be very small. The arsenical, and particularly the antimonial ores, which are not uncommon in Nevada, are still more difficult of decomposition than the simple sulphurets. The introduction, too, of pulverized ore into a furnace by means of a *blast*, and the strong currents of air thus produced, must of necessity entail a large mechanical loss in the finer portions of the ore, which would be carried up the chimney; a loss that would be unavoidable without the use of expensive condensing apparatus, and which, with rich concentrated sulphurets, would be very great indeed.

The invention, however, has at least the merit of not basing its fundamental claims upon the direct desulphurizing powers of steam or *carbon*.

We should be glad to learn more fully the details of the Keith method, as well as the various processes now being introduced for smelting the richer silver ores of Nevada and Colorado. Any reliable information respecting these processes, and the character of the ores treated by them, will be thankfully received by us.

LECTURE ON LIFE.—Mr. John Quincy Adams will lecture at the First Presbyterian Church, Stockton street, on Tuesday evening, April 10th, at eight o'clock. He has chosen as his subject:

LIFE.—The lecturer first dwells upon the abstract idea of Life; and from the works of creation, displayed in the Garden of Eden, deduces the consideration of the general and essential existence of the principle of life in Nature. It shows that Art imitates this principle; Mythology deifies it, and in it we behold the evidence of the being of a Creator. Associated with these ideas, are those of change and Death, considered in the abstract. The third principal division of the subject treats of Human Life; which it reduces to its elementary divisions and subdivisions, namely, the Physical, Mental and Spiritual Existence, with a review of their leading incidents. The concluding consideration is that of the Perfect Life, of which the Saviour was the type, and shows that in Him we live and have Eternal Life.

Mr. Adams is a member of the Society of California Pioneers, and the Young Men's Christian Association, of this city. He came from New York to this State when a child, in 1846, arriving here after a six months' voyage by sea, in March, 1847. He was one of the pupils of Mr. J. C. Pelton's first public school, in 1849, and has grown up with the city.

The object of the lecture is to assist the speaker in the completion of his collegiate course at the Benicia Law School. He has the hearty co-operation of several prominent clergymen, and from our own acquaintance with the young gentleman, we consider him both able and worthy, and trust he will meet a complete success. Tickets of admission for gentlemen and ladies, one dollar; single tickets, fifty cents.

NEVADA MINT.—Work will soon be commenced on the new United States Branch Mint, at Carson City, Nevada. Senator Nye telegraphs that the plans, etc., have been forwarded by mail.

MINING PARTNERSHIPS.

The new law concerning mining partnerships, published in to-day's issue, was introduced in the Assembly by Mr. Singleton, of Sierra. It elicited much attention in the Legislature during its passage, and was several times amended, and its provisions extended. Doubtless, by the perversions of selfish and dishonorable men, the law will work hardships to some owners in some instances, yet we are not without faith that, upon the whole, it may prove generally beneficial. It will certainly put an end to the practice that has long been prevalent, of one mean, contrary member of a company holding back and debarring the majority from proceeding with their prospecting. It will also cause men to be more careful who they take into copartnership with them in mining enterprises. Under the new partnership law, persons who enter into mining association with various parties should select associates of tried honor and virtue, or they will in the end get badly burned, frozen, or smoked out. In our opinion the law is too unlimited. Every owner in unincorporated mines should become familiar with it. We are satisfied that many miners will accept Mr. Singleton's law with favor. It will certainly accelerate mining, and soon put in operation hundreds of mines that are now lying dormant. The number of incorporations will likewise be increased. Upon a closer examination we shall speak further of the provisions of this act.

THE KNOX AMALGAMATOR.—This pan, an illustration of which is advertised in to-day's issue, has proved one of the most successful inventions in mining machinery. If we mistake not, it now stands the pioneer amalgamator at present in use in California and Nevada. Its cheapness in first cost, and its simplicity of operation are among its strong points, while another of its best recommendations lies in the fact that practical millmen repeat their orders for the Amalgamator and Separator, frequently using them in connection with pans of later pattern and invention. Mr. Knox has but few equals in his experience and intelligence in quartz mining and ore reducing, in either California or Nevada, and both the inventors and manufacturers of Knox's Patent Amalgamator and Separator, have well earned an envious reputation among those best informed of their merits.

FROM IONE, NEVADA.—A friend writes: My interests or business here, at this time, do not call me much out into the hills, but having a small but very rich sample of ruby silver presented to me the other day, I was led to the mine to see how easy it is to take out from the "Great Eastern," on London Hill, tons of good ore, since they have struck it big and rich. I could speak with good encouragement of several ledges doing well in furnishing good milling ore. We have two very important machines now before our miners here, viz., the Gardner crusher and Guiod's Crocodile. The latter is a very voracious chap, devouring, and I should say thoroughly digesting, a ton of quartz in 45 minutes. Many say it is a perfect success.

But of far more interest to us, as miners, is the Austin invention of a machine roaster to desulphurize and chloridize ore. [A description of the furnace, above named, will be found in another column.]

THE present yield of petroleum in the Eastern states, is estimated at 12,000 barrels per day, of which 11,415 barrels come from Pennsylvania alone.

ANTIDOTE FOR POISON.—If arsenic (ratsbane) is taken, swallow the white of an egg. If acid poison is taken, such as aquafortis, sulphuric acid, prussic acid etc., swallow soda and water or saleratus and water, or any alkali. Salt and mustard taken in warm water will vomit immediately.

FOURTEEN tons of rock from the Allison Ranch lead was crushed last week, which paid the sum of seventeen thousand dollars. It seems the longer they work this mine the better it pays.

NEW PUBLICATION.

ANNOTATED CATALOGUE of the principal species hitherto recognized in California and the adjoining States and Territories; being a Report to the California State Board of Agriculture: By William P. Blake, Geologist of the California State Board of Agriculture, and professor of Mineralogy, Geology, and Mining, in the Department of Science of the College of California: March, 1866.

This catalogue, just published, forms a pamphlet of thirty-two pages, and gives prominent localities of about one hundred different mineral species, together with short descriptive remarks upon the method of occurrence, and the character of the samples, yielded at the various localities named. It also contains a list of the principal publications, already extant, bearing upon the mineralogy and geology of California, together with notices of various mineralogical collections, both public and private, in this State; and several pages of interesting notes by the author upon the geographical distribution and general geology of the precious metals and valuable minerals of the Pacific Slope.

Prof. Blake has already contributed much in this direction, and we welcome the report, here noticed, as an important addition to our available knowledge of the mineralogy of California.

New York Metal Circular.

NEW YORK, March 2d, 1866.

TIN has declined without any business of consequence. We quote Straits, 25, Banca, 26, and English, 23½ to 23¾ cts., gold. Part of the arrivals of Straits from the East Indies had been sold previously. The importations for the month are 900 slabs Banca, 8,300 slabs Straits, (6 600 from the East Indies,) and 90 tons English.

SPELTER has been quiet, with a retail business only. We quote 6⅞@7 cts. gold. The imports for the month are 300 tons, and the stock 600 tons.

COPPER has been very unsettled. In the middle of February a few forced sales of Lake were made at 34½@35 cts., but this low price attracted speculation, and 500,000 to 600,000 lbs. Baltimore were sold at 35½@36 cts. The quotation was then 36 cts. for this kind, and 37 for Lake, but during the last few days sales have been made at lower prices. The bulk of the stock is not offered, and it is difficult to give reliable quotations. A parcel of 50 tons Chili Copper, imported from England, was sold on private terms.

The unfavorable advices from England contributed to the dullness of our markets, but it seems not unlikely that the lowest point has been reached there.

The last mail from Chili reports the blockade of Caldera raised, and the port of Valparaiso alone was not open at latest dates. Operations at the mines are represented as very much curtailed, and there seems to be no doubt that the supplies from the West Coast will fall short during this year.

LEAD has been very dull. Manufacturers have scarcely bought anything, as they are still supplied by their own importations. Small parcels of Spanish and German have been sold as low as 6½ and 6⅜ cts., gold. The better kinds of English are still held at 6¾ cts., gold.

The importations for the month are 2.300 tons; the deliveries for consumption are estimated at 1,500 tons, and the stock at 3,500, against 5,500 tons on March 1, 1865, and 800 tons on the same date 1864.

WINTERHOFF & Co.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, April 6, 1866.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent:

	Per ton.		Per ton.
12 per cent. ore	$24 00	22 per cent. ore	$65 35
13 " "	28 50	23 " "	69 10
14 " "	33 00	24 " "	72 90
15 " "	37 50	25 " "	77 20
16 " "	40 80	26 " "	80 70
17 " "	45 10	27 " "	85 00
18 " "	49 40	28 " "	89 10
19 " "	53 70	29 " "	93 25
20 " "	58 00	30 " "	97 50
21 " "	61 70		

To calculate the value of ors which assays 30 per cent. and upwards, multiply the per centage by $3 25, and you have the price which will be paid. For instance—suppose you have ore which assays 35 per cent—multiply 35 by $3.25, and you have $113.75 as the value of the ore. These prices, we believe, will be found substantially correct, and can always be realized.

IN 1865, the shipments of corn from Chicago reached 40,000,000 bushels.

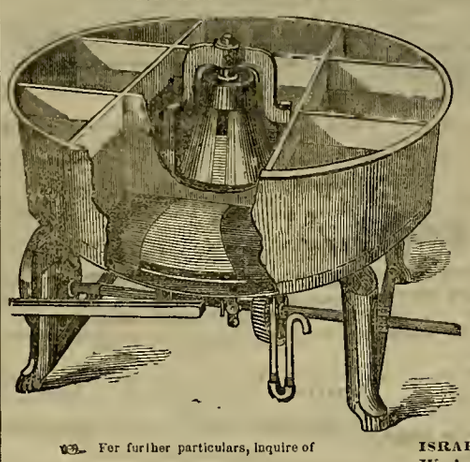
14v12-3m 🖙 At Reduced Prices. 🖘

Knox's Improved Patent Amalgamator and Separator,

With Palmer's Patent Steam Chamber or Die.



THIS CUT REPRESENTS AN AMALGAMATOR and Separator that has stood the test of NEAR YEAR'S practical working in the gold mines of California, and for nearly the same time in the silver mines of Nevada, having been introduced into the first steam mills built in the then Territory, since which time they have been successfully working against all competition.

The great advantages these Amalgamators have over any others, are—

1st. **Much less Cost.**

2d. They do not "flour" the mercury, and collect any that may have been "sickened" in the battery or grinders.

3d. The "slosbing" motion given to the pulp (by the revolution of the muller under the stationary frame) against the amalgamated copper plates that are fastened to the frame, and by this means catching the fine gold and mercury that will not settle.

4th. The gate in the cone, through which the pulp is discharged, where there is the least motion, almost precluding the possibility of any granulated mercury or fine gold escaping.

There are over 500 of them in use in California and Nevada, where those interested can see their practical workings.

🖙 For further particulars, inquire of ISRAEL W. KNOX, or W. A. PALMER, Inventors,

14v13-p12q At the Golden Gate Iron Works, No. 19 First street, San Francisco.

LIST OF OFFICERS OF CORPORATIONS AND MINING COMPANIES.

[PUBLISHED IN THE FIRST ISSUE OF EACH MONTH.]

[Below we give the date of recent meetings held in this city and the names of officers chosen or appointed. Every bona fide company is invited to send us the result of their election, to be thus put on record, gratuitously, with any other facts of general interest.]

DANEY G. & S. M. Co.—March 5th. Trustees: W. W. Palmer, W. B. Johnston, Ed. Martin, A. Pavillier, E. J. Pringle, C. Collischom, Ed. Balley. President, W. W. Palmer; Secretary, A. Noel; Treasurer, Bank of California; Superintendent, W. W. Palmer.

SIEMPRE VIVA SILVER M. Co.—March 26th. Trustees: P. H. Canavan, Charles Meinecke, B. Lefevre, Thomas Taylor, M. Scholl. President, P. H. Canavan; Secretary, John F. Lohse; Treasurer, C. Meinecke; Superintendent, E. Leya.

RECENT INCORPORATIONS.

TEMPLE SPRING PETROLEUM Co., located in Los Angeles county, California.—Capital stock, $240,000, divided into 2,400 shares of $100 each. Trustees: Chas. L. Low, A. C. Niehols, Ira P. Rankin, Natbaniel Page, and Francis De Loug.

GRAHAM G. & S. M. Co., located in Santa Cruz county, Cal.—Capital stock $200,000, divided into 2,000 shares of $100 each. Trustees: Washington Meeks, Milo Calkin, J. R. Sproul, W. B. Swain, and B. G. St. John.

YUMA M. Co.—Principal place of business is San Francisco. Capital stock, $20,000, divided into 200 shares of $100 each. Trustees: R. W. Kirkbam, Irwin McDowell and George F. Hooper.

IMPORTANT NOTICE.—In another column will be found an advertisement forwarded to us from New York, by the Wurtz Amalgamating Company, cautioning persons from infringing upon Wurtz's patent, by manufacturing and using sodium amalgam. The specifications and claims of this patent will soon be published in the MINING AND SCIENTIFIC PRESS.

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alterations which they may desire made in their advertisements at their earliest convenience. New advertisements should be sent in as early as possible.

SUBSCRIBERS who do not receive the MINING AND SCIENTIFIC PRESS in due time, are requested to inform the publishers.

CAUTION.

TO WHOM IT MAY CONCERN:—THE PUBLIC ARE hereby notified that a patent was allowed, December 27th, 1864, and issued June 27th, 1865, to PROFESSOR HENRY WURTZ, for the use of sodium and amalgams thereof with quicksilver, in the extraction of precious metals from their ores. All persons using said amalgams, or purchasing or selling sodium or said amalgams for use in the treatment of gold or silver ores, are hereby cautioned that they will be prosecuted to the full extent of the law.

The patents of Professor Wurtz have been assigned to the Wurtz Amalgamation Company of New York city. It is the intention of the said company soon to appoint agents for California and the other mining States and Territories. In the meantime, applications for licenses to use sodium and its amalgams, may be addressed to the company, at their office, No. 57 Broadway, New York.

C. ELTON BUCK, Secretary.

March 9th, 1866. 14v12-6t

Its correspondents are men of science and learning, and hail from all parts of the coast. It is published at San Francisco, at $5 per annum, or $3 for six months. Address Dewey & Co., publishers of MINING PRESS, San Francisco. [Nye County News.

Oakland Water-Cure.

APRIL 1ST, 1864, WE OPENED A HYGIENIC BOARDING House and Ladies' Health Institute in Oakland. The great advantage we have experienced since that time, in the treatment and cure of all those diseases peculiar to females, as well as those common to all, over that of San Francisco, induced us to give up the treatment of gentlemen in the city. We have accordingly removed our entire Bathing, Electro-magnetic, and Gymnastic Apparatus, which we used especially in the treatment of mates, to our Health Institute across the Bay, and have found, after a trial of seven months, that gentlemen as well as lady patients recover, at our Fountain Farm Cure, one-third faster than in the city of San Francisco. The climate here is the most even and bracing to be found in the State. The grounds command a view unsurpassed in the world. The Institution is furnished with an abundance of pure, soft water, from numerous springs; and we now offer to Ministers, Teachers, Lawyers, Miners, Merchants, Mechanics, Farmers, and all other worthy persons, who desire to try the advantages of the only *rational* system of medicine, the hospitalities of our Hygienic Home and Cure. Young men who have become debilitated or lost their health by excessive toil, exposure, or enervating habits, contracted through ignorance of Physical Laws, may with us find more of the encouragements they need, and means that will restore them to health, than elsewhere in California.

We claim for Water-Cure and Hygienic Medication superior advantages over all systems of drug medication in the cure of all disorders, whether acute or chronic; that it is followed by none of those debilitating diseases, such as Piles, Chronic Diarrhœa, Torpid Liver, Constipation, Intense Nervousness, Neuralgia, etc., nor those terrible Secondary Diseases, known as Varicose Swelling of the Veins, Necrosis, or Decaying of the Bones, Ulceration of the Limbs, Mercurial Rheumatism, Urethal Strictures, etc., which we well know result from the free use of mercury and other metallic drugs, together with stimulants and vegetable poisons given to overcome acute diseases.

The Oakland Water-Cure and Eye Infirmary is by far the most complete in the facilities for the cure of all diseases commonly treated in all Eastern Water Cures of any like establishment on this coast, and the only one in California conducted according to the Theory and Practice of the New York Hydropathic College. We use all forms of Warm and Cold Wet Sheet Packs, the Electro-Chemical Bath, Steam Baths, Improved Sitz Baths, Douch Baths, a Patent Spray Bath, and Magic Baths. The last named was instituted by Dr. Smith with special reference to the cure of those diseases peculiar to miners, namely: Rheumatism, Inflammatory or Chronic, Stiff Joints, Paralysis, Mercurial, Lead, and Oak Poisonings. It is a sure cure for Ague and Fever. It aids more than any other Bath we have yet used in eradicating all kinds of drugs and infectious poisons, and in the cure of all disorders induced by exposure to dampness and water, foul air, absence of light and electricity, retorting metals, the malaria of rivers and low marshy grounds. Where there was a fair constitution left, even when drugs had been applied for months and years without a cure, we have, in the past seven years, treated successfully the following diseases: Chronic, Inflammatory and Mercurial Rheumatism; Paralysis; Lung, Bronchial and Catarrhal Affections; Diseases of the Heart, Kidneys, Liver; Dyspepsia, Constipation, Enlarged Scrotum, Piles, Inflammation of the Bowels, Chronic and Acute Diarrhœa, and all diseases and weaknesses peculiar to male and females. No physician in California is so favorably situated to furnish so many home comforts and hygienic conditions that are indispensable to the speedy recovery of nervous and chronic invalids. We have the only truly healthful boarding place in the State for men, women and children, with plenty of saddle and carriage horses for the use of patients and boarders.

To that class of Diseases and Weaknesses peculiar to females, and the medication that Hydropathic or Hygienic physicians employ in their cure, do we invite the special attention of patients and their friends. The ease and rapidity with which females suffering from general or special debility, recover in the bracing climate of the Bay, under Hygienic Medication, together with the universal success that has attended the treatment of females at Dr. Smith's Institutions, both in Sacramento and San Francisco, has induced us to make this class of human afflictions a specialty of our Institution. We have treated (mostly in the cure), over 300 females, several of whom had been "bedridden" for months and years, and all have been decidedly benefited, and with but few exceptions, returned to their homes in from two to six weeks, so far recovered as no longer to need a physician. We have never yet learned of a single instance of a relapse into their former condition.

There is not one female invalid in twenty that has been suffering from nervous debility or diseases peculiar to her sex, that cannot be permanently cured by spending from four to six weeks at our Cure, and at the mere cost of $100. This statement we make in confidence, from an experience of the last seven years. From the many who have been treated at our Cure, we have yet to learn of a single regret from husband or wife of the time or means they have expended in Hygienic Medication.

NEW YORK, Aug. 1, 1853.

To all whom it may concern:

This certifies, that Dr. Barlow J. Smith is a graduate of the New York Hygieo-Therapeutic College, which College has a legal Charter from the Legislature of the State of New York, and is authorized to grant Diplomas, conferring on its students all and the same privileges and immunities in relation to the practice of the Healing Art, that are conferred by the Diplomas of any Allopathic or other Medical College in the country.

Dr. Smith has also devoted much attention to Phrenology, especially in its connection with Physiology and Pathology, a portion of the time under the instruction of Fowler & Wells, of this city, and has lectured successfully as a teacher and lecturer on these subjects.

R. T. TRALL,
Principal New York Hygieo Therapeutic College.

To all whom it may concern:

I have known Dr Barlow J. Smith, both in our office as a Student, and a practical Phrenologist in the country, and from what I know of him I can cheerfully recommend him as an honest, faithful delineator of character, and as such can cheerfully recommend him to the public.

For the good of Science.

L. N. FOWLER, 308 Broadway, N. Y.

Dr. Smith spends a part of each day in San Francisco, attending to family practice and to Phrenological and Physiological examinations at his office, Room 13 Armory Hall, up stairs, corner Montgomery and Sacramento streets. Office hours from 11 A. M. to 2 P. M. Circulars sent on application. Address,

BARLOW J. SMITH, M. D.,
20v11tf San Francisco, Box 473.

California Steam Navigation COMPANY.

Steamer CAPITAL.....CAPT. E. A. POOLE.
" CHRYSOPOLIS.....CAPT. A. FOSTER.
" YOSEMITE..... — —
" CORNELIA.....CAPT. W. BROMLEY.
" JULIA.....CAPT. E. CONCKLIN.

One of the above steamers leave BROADWAY WHARF, at 4 o'clock P. M. EVERY DAY (Sundays excepted), for Sacramento and Stockton, connecting with light-draft steamers for Marysville, Colusa, Chico, and Red Bluff.

Steamships AJAX, PACIFIC, ORIZABA, CALIFORNIA, ACTIVE and SENATOR, leave, as advertised, for Honolulu, Portland, Oregon, New Westminster, British Columbia, Victoria, V. I., Santa Barbara, San Pedro, and San Diego.

Office of the Company, northeast corner of Front and Jackson streets.

B. M. HARTSHORNE,
13v12 President.

Our Circulation.—THE MINING AND SCIENTIFIC PRESS has a large and permanent subscription list, and enjoys a more universal circulation among stockholders and persons directly interested in mining than any other paper on this coast.

OIL IN COLORADO,—The Denver *News* chronicles the finding of large quantities of oil in that State. It says: We have every reason to belive, from the indications and discoveries made, that portions of our Territory are as rich in petroleum as the celebrated Pithole District in Pennsylvania. Near Cacyon City, a well is now yielding twenty-four barrels per day of the best quality of "green oil." This well is only seventy-five feet in depth, and is the only well that has been sunk for oil in the Territory. Some others are going down, but none have as yet reached any conciderable depth.

PRACTICAL EDUCATION.—Among the novelties recently added to the Santa Clara College, says the San Jose *Mercury*, is a printing press, with a fine assortment of new type. The mechanic arts are now carried to a greater extent in this college than any other institution of the kind in this country. Electrotyping, daguerreotyping, telegraphing, practical assaying, engineering, printing, and various other arts and sciences are thoroughly taught. Two companies of cadets are also thoroughly trained in military tactics.

THE TERM COPPERHEAD.—It is perhaps worthy of interest, as settling any controversy that may arise, that the word "Copperhead" was first used in a political sense by Mr. John Russell Young, now of the *Tribune*, in a letter from Washington to the Philadelphia *Press*. This occurred in August, 1861.

THERE is a lump of gold in Washington, dug from the Montana mines, worth $17,000.

Trades and Manufactures.

Pacific Glass Works

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

20v11-1m

VOLUME TWELFTH.—The MINING AND SCIENTIFIC PRESS, with its last issue, commenced its twelfth volume. Since Dewey & Co. have "held the ribbons" its gait has been rapid toward a perfect journal. Its appearance evidences its prosperity, but doubtless, like some of the rest of us, it can stand increased encouragement. Let such be given, and, our word for it, volume thirteen will acknowledge receipt.—[Golden Era.

Book Printing should be considered and treated as one of the higher branches of the "Art of Arts," and its execution entrusted only to experienced and intelligent workmen. Strict attention will be given to all orders for BOOK AND PAMPHLET PRINTING entrusted to the Mining and Scientific Press Job Office.

ELECTROTYPE CUTS, ENGRAVINGS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State.

Metallurgy.

EUROPEAN
METALLURGICAL WORKS,
—AND—
Practical Mining School,
Bryant Street, Between Third and Fourth,
SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well-extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

Mining and Scientific Press
JOB PRINTING OFFICE,
No. 505 Clay street, corner of Sansome.

Stock Certificates of all kinds embellished with wood cuts and electrotype engravings. We devote special attention to the execution of all kinds of work required by Mining Companies, Machinists and Manufacturers.

BY MAIL.—The MINING AND SCIENTIFIC PRESS will be sent by mail to any part of the civilized world. In case of removal, subscribers have only to inform us of the post-office address of their old and new location, and the paper will be sent accordingly.

NEW MORMON TABERNACLE.—The building is in the form of an ellipse, with an extreme length of 259 feet, and width of 150. Extreme hight of roof 78 feet, hight of ceiling 68 feet. The immense roof-frame rests upon 44 cut stone piers, about 12 feet apart and 20 feet in hight, which gives 48 feet of spring to the arch. The 44 bents, or principal rafters forming the arch are composed of six thicknesses 2½ inch plank, framed like lattice-work, strongly pinned and bolted, and tied by fifteen horizontal cross-timbers on the outside, upon which the small rafters for the sheeting will be lain, and fifteen similar cross timbers inside, to which the ceiling-joists will be stayed. The thirteen half bents resting upon the thirteen piers in curve at each end, join diagonally upon the apex of the arch of the two outside parallel bents.

The stand will be in the west end—the floor to be level for a distance of sixty or seventy feet in front of the stand, thence gradually rising to the east end, where the seats will be eight feet above the level. It is estimated that the house will seat about 10,000 persons. For freedom of ingress and egress—a very material consideration where large audiences are concerned—ample provision has been made in the folding-door appointments of the entire space between the nine piers in line on either side. A cornice eight feet deep will surmount the stone work.

In the majestic, towering, self-supporting roof of this building there will be consumed nearly 100,000 feet of lumber. When finished, it will present the appearance of a ponderous half globe, with sides slightly compressed.

A YOUNG fellow has been congratulating himself upon having recently taking a very pleasant trip. Upon inquiry, it was found that he had tripped and fallen into a young lady's lap.

A Business Compliment.

PETALUMA, Oct. 4, 1865.

MESSRS. DEWEY & CO.—Gentlemen: Your note informing me that my patent for Crushing and Baling Machine is ordered to issue is at hand. Please accept my thanks for the prompt and business like manner with which the case has been conducted, and inclosed find twenty dollars for balance Government fees. Respectfully, etc.

JACOB PRICE.

1852. 1866

A NEW VOLUME.

Fourteenth Year of Publication.

THE GOLDEN ERA.

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents and contributors of distinguished ability in New York, Paris and London.

Miss BRADDON'S Greatest Sensation Story published from Advance Sheets:

RUPERT GODWIN;

—OR—

The Secret of Wilmindon Hall.

A NOVEL.

By Miss M. E. Braddon,

Author of "Lady Audley's Secret," "The Outcasts," "The Doctor's Wife," "Three Times Dead," etc.,

—IN—

THE GOLDEN ERA.

NOW IS THE TIME TO SUBSCRIBE!

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin—the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California and on the Pacific Coast, also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

"THOUGHTS AND THINGS"

APPEAR WEEKLY IN THE GOLDEN ERA.

Read "Thoughts and Things" in the GOLDEN ERA.
" Professor Clearquill," in the Golden Era.
" Dogberry," in the Golden Era.
" Alice Mason," in the Golden Era.
" Hugh Humphrey," in the Golden Era.
" Bill Dadd," in the Golden Era.

TO ADVERTISERS.

Best Advertising Medium.—The Golden Era is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village and mining and agricultural precinct in California, and offers unusual and unequalled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

BROOKS & LAWRENCE,

New Mining Advertisements.

Continued Mining Advertisements will be found under another head

Arroyo Seco Copper Mining Company, No. 1.—Location: Amador County, California.

NOTICE.—The annual meeting of stockholders of the above named company, for the election of Trustees, to serve for the ensuing year, will be held on THURSDAY, the 19th day of April, 1866, at one o'clock P. M., at their office, 415 Montgomery street.

R. WEGENER, Secretary.
San Francisco, April 3d, 1866. ap7

Batopilas Mining Company, Batopilas District State of Chihuahua, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 4th day of April, 1866, an assessment (No. 2) of twenty-five (25) cents per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, No. 311 Montgomery street, up stairs.

Any stock upon which said assessment shall remain unpaid on the 10th day of May, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 28th day of May, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. MARTINON, Secretary.
Office, 311 Montgomery Street, San Francisco, Cal. ap7

Eagle Quartz Mining Company—Location of Mine and Mill: Amador County, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 5th day of March, 1866, the several amounts set opposite the names of the respective shareholders, as follows:

To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents.

M. JEANNEL has discovered a new way of easily ascertaining whether there exists any lead in the tin used for tinning culinary vessels in hospitals. His method consists in this: Take about five decigrams of scrapings of the metal to he tested, and boil it in an excess of nitric acid diluted with one-third of its weight of water. When the solution is complete, filter and then put in a crystal of iodide of potassium. If the liqnid contains hut a ten-thousandth part of lead, a yellowish precipitate will he formed, which will not disappear hy the addition of an excess of ammonia.

A RECENT number of the Calcutta *Gazette* contains an account of an ærolite, which fell at Sherogtty on the 25th of August last. A native who witnessed its fall states that about 9 A. M. a stone fell from the heavens, accompanied by a very loud report, hurying itself in the earth knee deep, and at the same time the sky was cloudy and of a murky color, the air calm, and no rain. The stone has heen forwarded hy the Government to the Asiatic Society of Bengal.

J. B. CONE, BUSINESS AGENCY.—Makes private sales of Property and Business Places of every description, in the city and throughout the State; procures partners with large and small amounts of money; negotiates sales o mining property, and does a General Agency Business. GEORGE E. BROWN,

(Late Assistant Examiner in the U. S. Patent Office,)

HAVING RESIGNED THAT POSITION AFTER A TENure of office of eighteen months, offers his services to

INVENTORS AND THEIR ASSIGNEES,

—AS A—

Patent Solicitor,

He will make Preliminary Examinations in the Patent Office, with a view to ascertain the Patentability of any Invention that may be submitted to him for that purpose; will prepare the necessary papers for those who wish to make Applications for

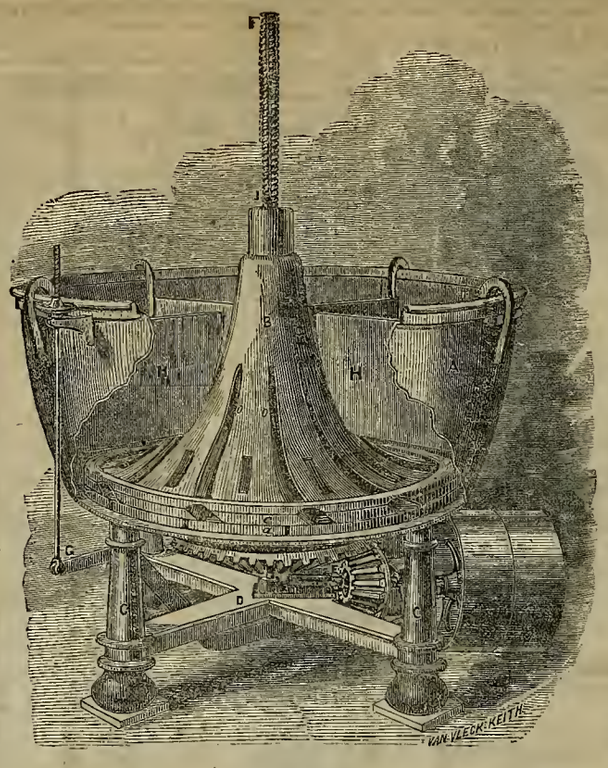
Patents for their Inventions,

—OR FOR—

EXTENSIONS OR REISSUES OF PATENTS

Already granted; will act as an Attorney in presenting Applications at the Patent Office, and in managing them to a final issue; will draw up Assignments; will examine into the condition of Rejected Applications when desired to do so, and undertake the prosecution of such as may be considered patentable, and do whatever else is usually done by Patent Solicitors.

Address, P. O. Box **257**, Washington, D.C. 7v12-3m



THE EXCELSIOR
GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and o, Openings,

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been furnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

THE PRESS is a large, sixteen page paper, and is truly a valuable assistant to the mining interests of the Pacific Coast.—[Nye County News.

BEGINNING EARLY.—The San Andreas *Register* says that an instance of youthful enterprise is evinced in "Little Charlie Sharp and Tommy Irvine, boys about twelve years old, who have been at work for the last week or two sinking a shaft on a claim they have located near town. The little fellows have built them a whim, and got it as scientifically as old miners. They have a pretty little shaft down about fourteen feet. They think they will strike the bed-rock soon, and expect to make their 'pile.'" Those youths will yet prove an ornament to the county which rears them.

A REASON.—'Mother,' said little Ned, one morning after having fallen out of bed, 'I think I know why I fell out of bed last night, it was because I slept too near where I got in.' Musing a little, while as if in doubt whether he had given the right explanation, he added, 'No, that wasn't the reason; it was because I slept too near where I fell out.

To Printers.

We have for sale, at a bargain, a Second-hand Half-Medium (largest size), Snggles' Engine Job-Printing Press, of most approved pattern. It is in excellent condition, and warranted to work as good as new. Apply soon, at the office of the MINING AND SCIENTIFIC PRESS. 19v11tf

BACK VOLUMES.

Back files of the MINING AND SCIENTIFIC PRESS, from January 1st, 1861, to the present time, will be furnished at $3 per volume of six months; bound in cloth, $5

A Good Financial Weekly.

Machinery.

EXCELSIOR DOUBLE ACTING
Suction and Force Pump.

W. D. Hooker's Patent, August 15, 1865.

THE SUBSCRIBERS OFFER FOR SALE the following sizes of the above-named celebrated Pump, acknowledged to be the best Double Acting Pump known to be in use. They are more easily set in position, and are more durable and compact than any other Double Acting Force Pump; they are also worked with very little friction, and have greater forcing power than other pumps of like size. They are adapted to work by hand, wind-mill, horse, or steam-power.

No. 1—Cylinder 2¾ in., stroke 6 in.
No 2—Cylinder 3 in., stroke 7 in.
No 3—Cylinder 4 in., stroke 10 in.
No. 4—Cylin er 5 in., stroke 15 in.
No 5—Cylinder 6 in., stroke 18 in.
The Nos. 4 and 5 are Mining Pumps.

We have also for sale a full assortment of Pump Fixtures, such as Iron Pipe, Hose, Brass Goods, etc.

J. W. BRITTAN & CO.,
12v12-3m 120 Front street,

Hepburn & Peterson's
AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, Bryant St. bet. 3d and 4th.

[Illustrated in the Mining and Scientific Press, April 9th, 864.]

HUNTER'S
PREMIUM
CONCENTRATOR, AMALGAMATOR
AND SEPARATOR,

Awarded a Silver Medal at the late Mechanics' Fair.

HUNTER'S CONCENTRATOR CAN BE SEEN IN OPERATION daily at the Novelty Iron Works, Fremont street. Parties wishing to purchase Concentrators will find it to their advantage to examine the above machine before purchasing elsewhere, for the following reasons:

1st. It will work the sands from a 5-stamp battery, and save from 10 to 20 per cent. more sulphurets than any machine built on the Pacific coast.

2d. The Sulphurets are washed clean, containing less than ten per cent. of sand.

3d. The waste tree gold and amalgam is amalgamated on the copper plates; not a particle of mercury and scarcely a trace of metal passes off with the sand.

4th. Its simplicity is a sufficient recommendation for its general use as a Concentrator. The variation of speed in a Quartz Mill does not effect the working of the Machine. The same was demonstrated at the late Mechanics' Fair, when with the greatest IRREGULARITY OF SPEED the best of results were given.

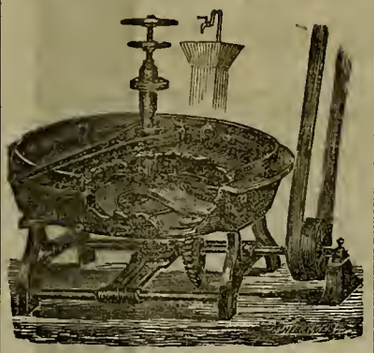
5th. There is no clogging or stopping to clean out the sulphurets and sand; consequently no waste from any inattention on the part of the attendant.

6th. In exhibiting the working of the machine (it is not ran empty), all classes of ores and tailings, from 50 pounds and upwards, are concentrated that parties may see it to test the machine with.

Give it a trial, and satisfaction is guaranteed All orders and any information required, address,

ANDREW HUNTER,
Novelty Iron Works, Fremont st., San Francisco,
15v11-3m Or to E. T. STEEN, Agent.

BAUX & GUIODS
Separator & Amalgamator



Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separaters, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIODS Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crail's Gravel Cement Works, Nevada county; Waltman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Heugh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6d†

4v10

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the **PACIFIC FOUNDRY,**
1v1 San Francisco.

Prater's Patent Concentrator

(Known as HUNGERFORD & PRATER'S Concentrator,)
MANUFACTURED AT THE
San Francisco Foundry and Steam Engine Works.

Corner Fremont and Mission Streets.

All orders promptly attended to.

2v12 **DEVOE, DINSMORE & CO.**

Stevens' Pressure Packing.

Patented March 7th, 1865.

Pressure Packing is now conceded, by the best engineers, to be the most effectual method of making and keeping the metallic ring of pistons steam-tight.

STEVENS' PACKING has the advantage of being cheaper in first cost than the ordinary packing, and can be applied to old style pistons with very little alteration or detention. In place of testimonials, the Patentee requests of those who are using the old spring packing to inquire of the owners of the various engines which now have this packing in use—some of which have been running from three to twelve months without being opened, or showing any descriptive leak—and act upon their recommendation.

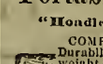
Further particulars can be had by applying to the Patentee, ANDREW STEVENS, Master Mechanic, Alameda Railroad, or at the VULCAN IRON WORKS, where they can be seen, at any time, in course of construction.

10df **ANDREW STEVENS.**

Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make,

COMBINING THE MAXIMUM OF EFFICIENCY, Durability, and Economy, with the Minimum of Weight and Price.



These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.

Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of milling enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Grist Mills.

For sale by **TREADWELL & CO.,**
3v12 3m Corner of Front and Market streets.

PETROLEUM STOVES.

A **MOST USEFUL INVENTION FOR ALL** manner of COOKING and for IRONING, without any litter, as ashes or soot. Cheap and convenient, and peculiarly suited to the wants of this community.

Cooking by them is divested of its disagreeableness, and becomes a pastime, as many can testify, who have used them in this city. To be seen at

316 Montgomery street,

Where they are for sale by

BULLARD & BATTLES,
Proprietors for California.

McAULEY & CHENEY'S PATENT

HYDRAULIC HOSE COVERING, OR SEAMLESS ROPE HOSE.

This is a new article, made by machiuery constructed for the purpose. The cordage used in its manufacture is made expressly for us by Messrs. Tubbs & Co. of this city, from the best Manila hemp.

As the Rope Hose Covering is formed without seam, ou an iron mandril or accurately turned cylinder, it is of perfectly equal size or diameter throughout its whole length. Owing to the peculiar manner of its construction, by which the ropes are twisted together and firmly held in place at each poiut of intersection, it is utterly impossible for the hose to get out of order or burst, even with the most careless handling, or from being caved on or sluiced out. Nor is there any chance for gravel to get in between the roping and canvas hose, as frequently happens with the ordinary roped hose. A single thickness of 000,000 duck hose inside our rope covering is sufficient to stand a pressure of three hundred feet, and can be made to stand a much greater pressure, if required. Old canvas, or hose that is worthless from age to use in the ordinary mauner, will last and be quite as serviceable as new canvas, for two or three years longer, if covered with our Rope Hose Covering.

The Rope Hose is made a little smaller than the duck hose, so as to take all the straiu. With this hose there is no possibility of collapsiug or bursting the inside hose, as frequently happens with even the most carefully made cauvas hose when of more than one thickness of canvas.

The Rope Covering will last from four to six years. It can be drawn on over ordinary canvas hose, either old or new, with as much ease as drawing one canvas hose over another.

DISTRIBUTORS with from two to six Gates.

HOSE PIPES with different sized Nozzles.

Orders for any of the above articles, or other Mining Apparatus, will receive immediate atteution. Address

J. L. MOULTHROP, Miners' Foundry, San Francisco.

LEAD AS AN AMALGAMATOR.—We give the following, taken from the *Weekly Mining Journal* as an additional commeot upon the molten lead process noticed last week:

It comes to us through a source which we deem reliable that—in short, read the following, and mark the fallacy of most human hopes and expectations: A competent assayer took ten dwts. of Bobtail blanket tailings, which it is well known have no lead in them, the same having been run through molten lead at Kip & Buell's mill, and as the results of an assay for lead, got three and one-half dwts. of that metal, about thirty-five per cent. He theo took an ounce of the same tailings, as they came from the stamp mill, and an ouoce that had been run through the molten lead, and as the result of an assay for gold and silver, got at the rate of one hundred dollars to the ton from each, there beiog no perceptible difference in the amount of gold and silver obtained from the two samples, one of which had passed through hot lead and the other had not. We give this publicity in the hope that further experiments may be made of the same kind. If the above results shall be confirmed, this spending of time and money oo what is called "the molten lead process," will be obviated, and it cannot be donc too soon. We repeat, that we have not the slightest reasoo to doubt the foregoing statemeuts with regard to the assays.

OUR NEW YORK AGENCY.

Mr. GEO. M NEWTON is our authorized agent in New York City, and will receive advertisements and subscriptions for the MINING AND SCIENTIFIC PRESS at regular rates. Sample copies of our weekly and monthly issues can be procured by calling upon him, at the office of the "STOCKHOLDER," **No. 72 William street.**

Parties wishing to subscribe or advertise in the MINING AND SCIENTIFIC PRESS can be accommodated by calling upon our Agent, Mr. TURNER HAMILTON, at the Assembly Building, 106 South Tenth street, Philadelphia, Pa., where samp copies of our publications can always be found.

THE PRESS is a large, sixteen page paper, and is truly a valuable assistant to the miniug interests of tha Pacifia Coast.—[Nye County News.

QUARTZ OPERATOR'S

HAND BOOK

A Book for Every Intelligent Prospector, Shareholder, Miner and Machinist.

ZENAS WHEELER AND P. M. RANDALL,

Authors and Publishers.

BOUND IN CLOTH—144 PAGES, DUODECIMO.

THE QUARTZ OPERATOR'S HAND BOOK is presented to the public as a carefully prepared epitome of all that is valuable for the practical operator in the miue and mill. We have here all the most necessary hints aud directions for testing and assaying the ores of the various minerals; an explanation of chemical terms; a brief and intelligible description of the numerous processes for roasting ores, and the extraction of metals from their ores by amalgamation and otherwise.

The work also contains an original and highly interesting discussion of the tractory and differently formed grinding plates, as applied to the reduciion of ores—a subject not only of special interest to the scientific reader, but also practically of the highest importance to every quartz miner

Professor Sillimau, of Yale, aod Hodgson, of tha College of Califoraia, having examined this discussion, as submitted to them by its author, Mr. Randall, previous to the compilation of this work, speak of the same as not only mathematically correct, but also as of great practical value. Messrs W. R. Eckart, Jr., Engiaeer, (late of U. S. N.,) and W. M. Belshaw, assayer and superintendent of the S. T. M. Co., to whom the entire work was submitted while passing through the press, speak of the same as one of high practical importance to quartz miners and millmen generally.

No work has been offered to the miniog public of Califoraia which contains so much valuable information, condensed into so convenient a space as is here presented. In its preparation, much care has been taken to secure brevity, concisenss, and simplicity—in fact to make it a complete and reliable QUARTZ MINER'S HAND BOOK.

The Table of Conteats of this book will be found on pa 415 of the MINING AND SCIENTIFIC PRESS of July 1st, 1865.

Sold by booksellers generally. Price by mail, postage paid, $1.25. Address "Wheeler & Randall, at the Mining and Scientific Press Office, San Francisco." 2v11

Important to Californians.—Many inventors have ately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government liccuse and revenue laws, as well as other new and imperative regulations. These disrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but activa and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

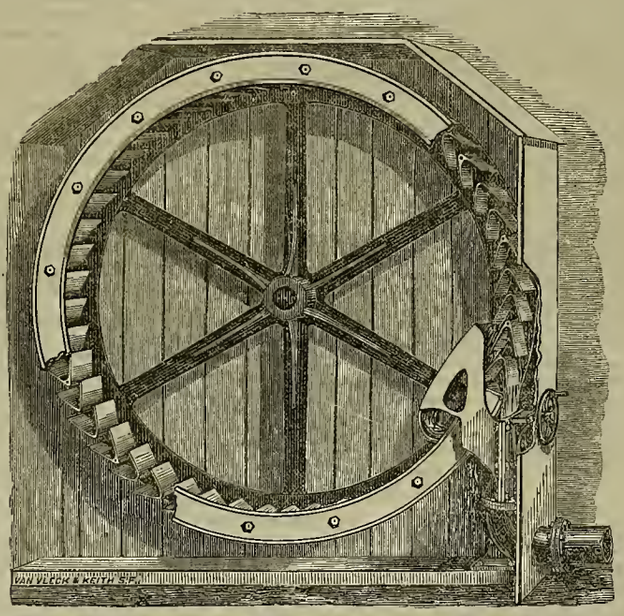
WONDERS OF THE ATMOSPHERE.—The atmosphere rises above us with its cathedrul dome nrching toward heaven, of which it is the most perfect synonym and symbol. It floats around us like that, grand object which the apostle John saw in his vision—"a sea of glass like unto a crystal." So massive is it that when it hegins to stir, it tosses great ships like playthings, and sweeps city and forest like snowflukes to destruction before it. And yet it is so mobile that we have lived for years in it before we eun be persuaded that it exists at all, and the great bulk of mankind never realize the truth that they are bathed iu an ocean of air. Its weight is so enormous that iron shivers beforo it like glass, yet a soap bubble sails through it with impunity, and the tiniest inseet waves its aside with his wing. It ministers lavishly to all our senses. We touch it not, but it touches us. Its warm south wind brings back color to the pale face of the invalid; its eool west wind refreshes the fevered brow und nukes the blood mantle to our cheeks; even its north blast braees into new vigor the hardened children of a rugged climate. The eye is indebted to it for all the magnificence of sunrise, the brightness of midday, the chastened radiance of the morning, and tho clouds that eradle near the setting sun. But for it the rainbow would want its trinmphant areh; and the wind would not eend its fleecy messengers on errands around the heavens; the cold ether would not send snow feathers on the earth, nor would drops of dew gather on the flowers. The kindly rain would never fall, aor hail-storm nor log diversify the face of the sky. Our naked globe would turn its tanned and unshadowed forehead to the sun, and one dreary, monotonous bluze of light and heat dazzle and burn up all things. Were there no atmosphere, the evening sun would in a moment set, and without warning, plunge the earth into darkuess. But the air grasps in her hand a shield of his rays, and lets them slip through her fingers so that the shadows of evening are gathered by degrees, and the flowers have time to bow their heads, and each creature space to find a plaee for rest, and to nestle to repose. In the morning, the garish sun would at one bound burst from the bosom of aigbt and blaze above the horizoa; but the air watches his eoming, and sends first but one little ray to another, and then a handful; and so gently draws aside the eurtain of nigbt, and slowly lets the light fall on the face of the sleeping earth, till her eye-lids open, and like a man she goes forth again to labor until evening.

A LARGE OIL TANK.—Messrs. Brewer, Burke & Co., of Pitsburg, Peun., are ereeting an iroa oil tank capable of holding 12,000 barrels.

TANGENTIAL TURBINE WATER WHEEL.

The annexed illustration represents what is known as the tangentiul turbine, or hurdygurdy water wheel, with a reaction guide, whereby the water having onco impinged upon tho buckets of the wheel, is mude to react upon succeeding buekets until the force of the rush of water is entirely exhausted, eo that it drops quietly from the wheel by the mere force of its gravity. The construction of the wheel may be distinctly seen iu the engraving. The water is seen to rush in, through the conducting pipe, with a veloeity and impulse due to its head. After striking the buckets and passing into the inner side of the eircumference of the wheel, it will be observed to be so directed in its motion as to again receive an upward direetion, striking the buckets at a point below tbe place of first contaet, when it imparts the whole of the power remaining in the water after its first impulse.



TANGENTIAL TURBINE WATER WHEEL.

The wheel is now ia successful operation at Hydliff's Mill, in You Bet; at the Empire Tunnel Company, French Corral; at the Crœsus Silver Mill Company, Kearsage; at the Clear Creek Company's Mill, in Tulare county, and other places. It gives a high percentage of work for water eonsumed; is exceedingly simple in its construetion, and eosts but little, in comparison to most water wheels. It is particularly applicable for high falls, and where the water caa be eonveyed along and down mountain sides, by means of pipes, as in hydraulie mining. The wheel is manufaetured at the Miners' Foundry in this city. A wheel eight feet in diameter eosts but $500, and is estimated to be capable of performing the following duty: With—

80 feet fall and 94 inches water, miners' measure.				
100	"	75	"	"
125	"	60	"	"
150	"	50	"	"

it will run a mill of 10 stamps, eaeh 650 pounds, 85 drops per miuute, and 11 inehes eaeh drop. With—

175 feet fall and 85 inches water, miners' measure.				
200	"	75	"	"
250	"	60	"	"
300	"	50	"	"

it will run a mill of 20 stamps, each 650 pounds, 85 drops per minute, and 11 inches eaeh drop. The wheel is furnished of different sizes to suit the wishes or necessities of the purchaser.

BULLION FROM GOLD HILL.—The Gold Hill *News* says: "The amount of bullion shipped from the Gold Hill Express office, for the month of March last, amounts to $590,123.89. For the quarter ending March 31st, 1866, the shipments reached $1,397,659.70! Thus, it is manifest that no less than five millions of raw silver and gold will be dug out and exported from this little burgh during the year 1866. These are items for the desolate, and torture points for the eroakers."

AN INTERESTING FACT.—During our reeeat visit to the mines of Grass Valley and Nevada, a very interesting fact eame under our notice, to the effect that all the distinetive features which are so observable in the mines for the first 150 or 200 feet in depth, disappear beyond that depth, and that the veinstoae thereafter presents a uniform eharacter; so much so, that when speeimens from the lower levels of the deepest mines arn thrown together promiscuously, it is almost impossible to distinguish the one from the other. On visiting the Sneath & Clay mine, at Nevada, we fouad the same eharaeteristie to prevail; the veinstone of that miae being quite indistinguishable from that from aay of the deep miaes of Grass Valley. The solitary exception notieed is in the Norambagua, below Grass Valley. The only mine, we believe, in Nevada eounty earrying any notieeable quantity of arseaical pyrites.

GREAT BRITAIN alone produces one-third of all the iron product of the world.

SODIUM AMALGAM.—Our readers will find a very interesting letter on the eecond page of the preseut issue, in relatinn to the discovery of the use of sodium amalgam in working gold ores. The letter eontains a brief aecount of tho discovery and the most eesential portion of the specifications of the patenten. It will be seen that among the advantages etaimed for the amalgam is that of faeility of packing and transporting the solid amalgam. In this connection, we would etate that two or three experiments, of whieh we are eognizant here, would eeem to iudicate that when this solid amalgam is expoeed to the aetion of the air, the sodium gradually oxidizes, and the solid soon melts into a liquid mase, eurrounded by eaustie soda. If there is not some simple means of preventing this aetion, it will bn impoesible to transport mercury thus, in the eolid state, withtont packing it in nir-tight vessels. We should be glad to know bow Mr. Wurtz ohviates tbis difficulty. Further and *careful* experiments are needed, and many points conneeted with the application and nse of the sodium amalgam. It is a subject that well deserves to be thoroughly and practically investigated, and we shall be happy, at any time, to reeeive and publish the results of *careful* and *reliable* experiments in relation to it.

THE UNION AMALGAMATOR.—We would call the attention of millmen, and others, to the advertisement of the Union Amalgamator, whieh appears in our columne to-day. But little effort hns heretnfore been made to introduee thie pan to public notiee; yet all whn have used it, so far as we have learned, unite in pronouneing it highly effieieat, both ae an amalgamator and as a triturator. It is so eonstructed as to be run with great speed, presenting a double grinding surface, revolving in opposite directions; whieh motion effeets a thorough mixiag of the pulp, and admits of n speed three or four times ae rapid as pans where the motion ie single. By this arrangement great eeonomy in weight of metal, cost and epace is secured. It is probably more readily and easily eleaned up than any pan in use. It may be seen in operation every day at the San Francisco Foundry (Devoe, Densmore & Co.), eorner of Mi-sion and Fremont streets. Millmen and others interested in euch machinery visiting this eity, will do well to eall and examino tbis pan and witness its operation at the place above designated.

THE STANDARD SOAP CO., of this city, manufaeture a most excellent artiele of washing powder, said to excel anything of the kind in use; and to eontain nothing that will injure the finest fabric. It also possesses the merit of working equally well in either hard or soft water. It is much more eonvenient for uee than soap, either hard or soft. It is for sale by the grocers generally, so that a trial of its virtuee may readily be made by any one deeiring to do so. See advertisement in another column.

TO CORRESPONDENTS.—"Progress" is welcome; we should be pleased to hear from him often. Another letter from our regular correspondent "D." next week. "O. W. E." and "R. P." will appear.

Sodium Amalgam---Wurtz's Patent.

The American *Journal of Science* for March, contains the following interesting letter addressed to Professor Silliman by Henry Wurtz, of New York, the discoverer and patentee of the use of sodium amalgam for extracting the precious metals from their ores:

In the opinion of yourself and others upon whose judgment I rely, the time has arrived for the promulgation of the discoveries made by me, now many years since, of certain new properties of the alkali-metals, rendering them of value in the amalgamation of ores of the precious metals.

You are aware that, pending the repeated investigations which I have conducted upon this important subject, I have made communications of my results, both oral and written, from time to time to many persons, yourself among the number; but that until the latter part of the year 1864, no final step was taken to place these discoveries before the public in a tangible form. On the 27th of December, 1864, a patent of the U. S. Government was granted to me for specified modes of applying the said discoveries; the specification having been at my request retained on file in the Patent Office for six months (as the new patent law permits); so that the expiration of the term of this patent did not commence until the 27th of June, 1865.

It appears, however, that my frequent communications had led to wide discussion of the remarkable phenomena involved, phenomena which I seldom hesitated to exhibit, even to the most casual acquaintances, taking only the precaution of silence as to the agent employed (the sodium); and the inevitable consequence has been the occupation of other minds with the subject, both here and abroad. In fact, since the issue of my patent, I am informed that several applications (necessarily fruitless) have been made at Washington by others for patents covering some or all of my uses of the alkali-metals; and an English patent has been procured in the name of the eminent chemist Wm. Crookes, dated August 12, 1865 (about eight months subsequent to the filing of my specification at Washington); of the specification of which I have procured a copy, and find it to present a remarkable similarity to my own. Moreover, I frequently find allusions and statements relating to this subject, generally more or less imperfect and obscure, in the public prints throughout the world.

It has clearly, therefore, become incumbent upon me—if only as a matter of justice to the mining community and others interested—to furnish authentic information as to what has actually been done, and what it is proposed to do. I have, therefore, prepared an abstract of my specification, embodying in a condensed form such portions of its substance as appear of present importance to miners and metallurgists.

Other portions of the subject-matter of the specification will form a sufficiently voluminous, and I hope interesting, topic of a future communication; as, for instance, my new modes of preparing amalgams of the alkali-metals in large masses with any desired rapidity, safety and economy; and which you, with other chemical scientists who have witnessed its operation, deem important in a purely scientific view; as involving novel phenomena, and illustrating molecular laws obscurely seen at present.

With a few explanatory observations, which seem needed, I shall conclude. I have found it necessary, for practical purposes, to prepare three different grades of the sodium amalgams, from each other in their proportions of sodium, about as the numbers 1, 2 and 3; and which I designate accordingly.

A few lines, also, regarding the term "magnetic amalgams," which not a few will deem fantastic, and as suggesting unauthorized analogies. I hope to show, however, at some other time, that in applying the term I have followed the dictates of reason, and even the direct path of the modern leaders in cosmical dynamics, the apostles of the doctrine of correlation of physical forces; and that the analogical element which I find is between attractive and repulsive antagonistic force which exerts a *chemical*, or rather an *elementary discrimination* between bodies at *insensible* distances, and the antagonistic force of magnetic attraction and repulsion, which is so eminent an example of a similar elementary discrimination, though at *sensible* distances also. No one (to offer an illustration nearly, though not quite perfect) doubts the intimate relation between radiated and convected heat, although the one propagates itself throughout the universe of space, whilst the other is susceptible only of diffusion throughout insensible distances, from molecule to molecule.

More of this, however, hereafter. The term, from its convenience alone, will doubtless come into extensive use, as a technical term, among those who are most concerned in the utilization of the magnetic amalgams.

39 Nassau St., New York, January 15, 1866

SPECIFICATION.

My invention consists: In imparting to quicksilver * * a greatly enhanced adhesion, attraction, or affinity for other metals and for its own substance; by adding to it one of the highly electro-positive metals * * sodium, potassium * * etc.

My invention * * is applicable:

1st. In all arts and operations in which amalgamation by quicksilver can be made available to separate or extract gold, silver or other precious metals from their ores.

* * * * * *

3d. In all operations in which amalgamation by quicksilver, in conjunction with reducing metals, such as iron or zinc, can be made available in recovering metals from their soluble or insoluble saline compounds; such as silver from its sulphate, chlorid or hypo-sulphite; lead from its sulphate or chlorid; gold from its chlorid or other solution.

* * * * * *

8th. In the mercurization of metallic surfaces in general, for instance, in the amalgamation of the surfaces of zinc in voltaic batteries; of the surfaces of copper plates, pans, etc., used in the saving of gold from its ores; * *

9th. In the more convenient transportation of quicksilver, by the reduction thereof into solid forms.

* * * * * *

I shall now proceed to the description of those special and peculiar qualities of these amalgams of the alkali-metals which I have discovered, and which have led to my new uses of them in the chemical and metallurgic arts.

A quantity of one of the magnetic amalgams, dissolved in one hundred times its weight or more of quicksilver, communicates to the whole a greatly enhanced power of adhering to metals; and particularly to those which, like gold and silver, lie toward the negative end of the electro-chemical scale. This power of adhesion, in the case of these two metals, is so great, that the resistance which I have found their surfaces, when in the native state, usually oppose to amalgamation (a resistance which is much greater and more general than has been hitherto recognized, and which is due to causes as yet undiscovered, or at least uninvestigated) is instantly overcome; whether their particles be coarse, fine, or even impalpable. Even an artificial coating of oil or grease (which is such an enemy to amalgamation that the smoke of the miners' lamps is pronounced highly detrimental in gold and silver mines) forms no obstacle to immediate amalgamation by this magnetic quicksilver. The atoms of the quicksilver are, as it would seem, put into a polaric condition by a minute addition of one of those metals which range themselves toward the electro-positive end of the scale; so that its affinity for the more electro-negative metals is so greatly exalted that it seizes upon, and is absorbed by, their surfaces instantaneously; just as water is absorbed by a lump of sugar or other porous substance soluble in it.

Such quicksilver (unlike ordinary quicksilver) even adheres strongly to surfaces of iron, steel, platinum, aluminum and antimony; an adhesion which, however, as I have discovered, in the case of these five metals is not of the nature of a true amalgamation, there being no penetration whatever into the substance of the metal; so that the superficially adherent magnetic quicksilver may be readily wiped off clean, just as water may be from glass. The only metal I have as yet found, which cannot be enfilmed by the use of the magnetic amalgam, is magnesium.

I. *Applications of the magnetic amalgams to working the ores of the precious metals.*

My improvement in methods of amalgamating gold and silver ores consists in adding from time to time to the quicksilver used in amalgamation, about one-hundredth part, or less, of its weight of one of the magnetic amalgams. The frequency with which the amalgam is to be added cannot be exactly specified, as it will be found to depend more or less on a multitude of circumstances; such, for instance, as the temperature, the purity of the water and the quantity of water used, the ratio borne by the surface of the quicksilver to its mass, the amount and mode of agitation of the quicksilver, the nature of the process and of the apparatus used, the character of the ore, the strength of the amalgam, etc., etc.; so that this important point can only be determined by experience in each case. Some general directions may, however, be derived from the experiments which have been made. It has been found that very much less sodium is requisite in those cases in which much water is employed, and that water frequently renewed; for instance, in the riffles of a sluice, and in all forms of amalgamators through which a continual current of fresh water is kept running; mercurial solutions of sodium, as I have discovered, being little affected by water which is free from acid, alkaline, or saline impurities. In those cases, however, in which little water is employed, and especially when the ore and quicksilver are ground up together into a "slum" or slime, this water soon becomes alkaline, and an oxydation of the sodium sets in, necessitating its frequent renewal. In such cases, therefore, the following manipulation is recommended: The whole amount of quicksilver to be used for working up a batch of slime, say 50 pounds, is magnetized by dissolving in it one per cent. of amalgam No. 2; or better, two per cent. of the soft amalgam No. 1, which dissolves more readily; half of the whole, or 25 pounds, is then thrown into the mill with the ore at first, and, as the incorporation proceeds, certain fractions of the other half are gradually added, at intervals of time varying according to circumstances, until the whole has been added. If, as is usual, the quicksilver is a portion which has been separated from the slime of a previous operation, it will usually retain some sodium, and therefore will require fresh amalgam in proportionately smaller quantity.

In sluicing operations the soft amalgam No. 1 is most suitable, on account of its ready solubility in mercury; and in these cases it is practicable to *test* the quicksilver in the riffles and ascertain when the magnetic quality requires restoration, by throwing in a few grains of gold-dust. Similar tests are easily applied to slimes, and in amalgamating methods generally, a slip of tarnished sheet copper being a very suitable agent for such testings.

It may be remarked in passing, that the amalgam No. 1 is at any time easily prepared from No. 2, by melting it in an iron ladle with about its own weight of quicksilver, or from No. 3, by melting with twice its weight; considerable time, however, being requisite, in the case of No. 3, to produce the additional combination. In copper-plate amalgamation, that is, in those cases in which auriferous materials are brought into contact with amalgamated metallic surfaces, it is better to substitute altogether for quicksilver itself (both in the first coating of the metallic surfaces, and in any subsequent additions of quicksilver made) the pasty amalgam No. 1. In these modes of amalgamation great economy in wear and tear of apparatus, as well as in first cost, is effected by using, in connection with the magnetic amalgam, plates or surfaces of *iron* instead of copper. The power of coating or enfilming iron renders the amalgams in fact peculiarly valuable in every form of arastra, drag-mill, or other apparatus for amalgamation which has internal surfaces of iron, these surfaces becoming coated over with quicksilver, and thus immensely extending its chances of contact with those particles of gold which are so fine as to remain suspended in the water.

Other important devices arise out of this power of enfilming iron surfaces, such as the keeping of iron surfaces of stamps, and of other apparatus used in *crushing* ores continually coated with quicksilver. Quicksilver possessed of the magnetic quality may be kept dropping or trickling upon the surfaces of crushing-rollers; or in those crushers in which iron balls are used, the surfaces of these balls may be kept enfilmed. In like manner as the *adhesion* of quicksilver to other metals is exalted by the alkali-metals, so, also, as I have discovered, is its *cohesion* with itself greatly increased. It is rendered more viscid, more difficult to divide mechanically, and when thus divided runs together again instantly upon contact. Hence arise new results of incalculable value. For instance, the so-called "flouring" or granulation of the quicksilver, which in the amalgamation of ores always occasions so great losses, both of the quicksilver itself and of its amalgams with the precious metals, is reduced to a *minimum* or altogether prevented.

The recovery of floured quicksilver and amalgams from slimes and similar mixtures is also greatly facilitated and accelerated thereby. For this purpose some strongly magnetized quicksilver is thrown into the separator. Such slimes may even be operated upon with advantage by the ordinary process of *panning by hand;* a little magnetic quicksilver being thrown into each pan and stirred about at first for a few moments with the hand, which will collect together and incorporate all the scattered globules of auriferous amalgam. In fact, in all panning operations, even upon the pay-dirt of placer diggings, much labor, gold, and time may in this way be saved.

It is necessary to specify an important precaution applicable in some cases in which magnetic amalgams are used, and particularly in those cases in which the ore is ground or agitated with quicksilver in contact with metallic iron. This arises from the liability of the adhesion of some abraded particles of iron to the amalgam. The following plan is therefore recommended in these cases: The amalgam, after separation from the excess of quicksilver, and before retorting, is fused in an earthen dish or iron ladle (with addition of a little quicksilver, if necessary, to make it more fluid), and the iron, which will rise and form a scum on the surface, is skimmed off. The excess of quicksilver may then, after cooling, be again separated from the amalgam in the usual way. Any amalgam which may adhere to the iron-scum is readily detached therefrom by boiling in water to remove the sodium. This process depends on the simple fact that the adhesion to the iron totally disappears with the extraction of the last traces of sodium from the quicksilver. In fact, it is possible to remove all the iron from the amalgam by boiling directly in water, without any previous fusion; more particularly if the water be made somewhat acid or alkaline. The presence of iron in a sample of amalgam is readily detected by the magnet, which instrument may be sometimes used to advantage also in separating intermixed iron from amalgam, after all sodium has been extracted from the latter. There are still other metals which will usually be found adherent to the amalgam when sodium has been used; such as platinum and osmiridium. These, like iron immediately detach themselves on the removal of the sodium by boiling the diluted amalgam in water. A mixture of platinum or osmiridium, or both, with iron, may of course be freed from the latter by the magnet. It will generally be found desirable, as in other cases where quicksilver is used and ores containing arsenic or sulphur operated upon, to remove as much as practicable of the arsenic or sulphur by previous roasting or other chemical treatment.

* * * * * *

III.—*Applications to the recovery of metals from their saline compounds.*

In the common operation of reducing silver to an amalgam from its native or artificial chlorid, or from its sulphate, by the action of metallic iron or zinc in conjunction with quicksilver, immense advantage arises from the use of the magnetic amalgams, especially in the reduction of the time occupied to a fraction of that heretofore required. This applies as well to ores in which the silver occurs naturally as chlorid, bromid or iodid, as to those in which the silver has been previously converted into chlorid, or sulphate, or both, by roasting with common salt or otherwise; and to chlorid which has been precipitated from solution. * *

When gold has been obtained in solution, either from ores or from other materials, by the action of chlorine, aqua-regia, cyanid of potassium, or any other solvent, also when silver has been obtained in solution, in hypo-sulphites or otherwise, the most rapid and thorough mode of saving these metals will be found to be their conversion into amalgams, by precipitation with metallic iron in contact with magnetic quicksilver, more especially when the solutions are dilute. * *

The greater rapidity and perfection of the precipitation, in these cases, are obviously due to the absolute contact at once established with the iron surfaces by the magnetic quicksilver, and the perfect and powerful voltaic circuits thus kept up constantly throughout the two metals and the solution.

* * * * * *

VIII.—*Applications to the Mercurializing of Metallic Surfaces in general.*

In all cases in which it is an object to save time and labor in the coating of surfaces of other metals with quicksilver, * * * the magnetic amalgams come into play. * * *

By virtue of the adhesion to iron and other non-amalgamable metals imparted by the magnetic amalgams, I am enabled to apply quicksilver, or fluid or pasty amalgams, to any metallic surface, with great rapidity and facility, *with a brush*, after the fashion of a paint; the material of such brush being fine wire of iron, steel, aluminum, or platinum. Of these the material most generally suitable is the finest steel wire, tempered to about a spring temper, or somewhat softer; and the most generally useful form for such brushes, is that of a *flat* varnish or white-wash brush.

Among the important uses of such brushes may be instanced; the amalgamation of copper (or iron) plates used in saving gold from ores; * * *. Another valuable use is the recovery of quicksilver which has been spilled or scattered in the form of globules; such a flat brush, saturated with magnetic quicksilver, instantly collecting, incorporating, and sucking up the scattered globules, even from the most irregular surface.

The same principle of adhesion of magnetic amalgams to a brush of steel wire, is applicable, in many obvious ways, to the separation of metals from ores, and of granulated or floured quicksilver from ores and slimes, etc.

* * * * * *

IX.—*Applications to the Transportation of Quicksilver.*

The ordinary mode of packing and transporting quicksilver in bulk, is very expensive and troublesome; and in its ordinary form its transfer from one vessel into another is accompanied by great liability to loss. It will therefore be found very convenient and useful to possess simple, cheap and practicable modes, such as those described above, of converting it into solid forms, susceptible of transportation in vessels of lighter and cheaper material than the ordinary wrought-iron bottles; such, for instance, as glass or earthen ware jars, wooden

kegs, bags or bottles, or other envelopes of caoatchoue or gutta-pereha, etc., etc.

This plan also enables quicksilver to be packed, stored, transported and sold in convenient forms; such as bars, ingots, cylinders, blocks, cubes, spheres, or pellets, of definite sizes and weights, the convenience of which for many uses, and particularly for that of miners, is at once obvious. When the quicksilver is to be used in any of the arts above specified, it will then be already in a suitable condition, or will merely require admixture with some fluid quicksilver; and when to be used as pure quicksilver, the sodium may be removed by throwing the solid amalgam in fragments into hot water, preferably mixed with a little sulphuric or acetic acid.

The modes of packing such ingots, for preservation and transportation, are already sufficiently set forth in a preceding paragraph.

Claims.—The claims attached to this specification are twenty three in number; and those only are here given which directly concern the miner and amalgamator.

What I claim as my inventions are:—

1st. The combination with quicksilver, when used for the extraction by amalgamation of any metal or metals from ores, slimes, and mixtures with other materials; of metallic sodium, or metallic potassium, or any other highly electro positive metal equivalent in its action thereto; as above set forth.

2d. In those amalgamators in which amalgamated plates of copper or other metal are used; the substitution therefor of plates or surfaces of iron, coated with quicksilver combined with sodium, or other highly electro-positive metal; as above set forth.

3d. The coating of iron surfaces, between or under which ores or other materials are crushed, with quicksilver combined with sodium, or other highly electro-positive metal; as above set forth.

4th. The prevention of the granulation or flouring of quicksilver, when used in any method of amalgamating ores or other materials; by addition thereto of sodium, or other highly electro-positive metal; as above set forth.

5th. The separation of intermixed iron from double amalgams of gold and sodium, or of silver and sodium; by fusion with excess of quicksilver and skimming; as above set forth.

6th. The separation of intermixed iron, platinum, osmiridium, and other non-amalgamable metals, from amalgams containing sodium or its equivalent; by action thereupon of water or other oxydating liquid; as above set forth.
